Since the appearance of *Corpus Philosophorum* VIII in 1979, DET DANSKE SPROG- OG LITTERATURELSKAB (The Danish Society of Language and Literature) and *Corpus* have lost the last of the two founders of this series: Dr HEINRICH ROOS, S.J. (1904-1977) and Dr ALFRED OTTO, S.J. (1903-1982). Moreover, Professor JAN PINBORG (1937-1982), who had carried on the work of the founders, recently succumbed to illness in the midst of his many tasks for Copenhagen University and for Danish and international collaboration projects. These scholars and their work will be remembered with the greatest respect by the Society.

The management of *Corpus* has been handed over to Dr STEN EBBESEN, who worked with Jan Pinborg on vol. IX: *Boethii et aliorum Sophismata*. This volume has been delayed, but the number will be reserved for it because of its connection with the other Boethiana in vols. IV-VIII.

For the present, the first part of vol. X is being issued. In this Mr FRITZ SAABY PEDERSEN, Lic. Phil., presents the two (perhaps identical) astronomers PETRUS PHILOMENA DE DACIA and PETRUS DE SANCTO AUDOMARO. For practical reasons this volume is being divided into two parts, and the second will appear in 1983. Some of the treatises edited are brief, but they are contained in numerous, widely spread manuscripts requiring extensive study, notwithstanding the preparatory work carried out, in particular, by Professor OLAF PEDERSEN (Aarhus University).

In addition, Mr N.J. GREEN-PEDERSEN is working on NICOLAUS DE DACIA: *Quaestiones super Priora Analytica* (ms. from 1342), and Professor SØREN SKOVGAARD JENSEN (Odense University) on THUO DE VIBERGIA: *Quaestiones super Metaphysica* (ms. from 1438). It is also hoped to reissue ANDREAS SUNONIS: *Hexaëmeron*, a creation epic of 8000 verses, as well as a large astrological work by another NICOLAUS DE DACIA:

Libri tres Anaglypharum (c. 1450). A further volume of scientific treatises is envisaged, whereafter it is intended to bring *Corpus* to an end with a volume that will gather up any texts recently discovered and contain certain improvements to the whole series.

The Society is deeply grateful to the CARLSBERG FOUNDATION, the steadfast and of late the only source of grants for the printing of *Corpus Philosophorum*. We also thank the printer FR. BAGGES KGL. HOFBOGTRYKKERI for their excellent collaboration, in particular regarding the complicated typographical problems set by the present volume.

Torben Nielsen
/Erik Dal

I wish to express my thanks to the INSTITUTE FOR GREEK AND LATIN MEDIEVAL PHILOLOGY, University of Copenhagen, directed till lately by Professor JAN PINBORG, now by Dr STEN EBBESEN, of whose friendly, clear and sound advice I have continually enjoyed the benefit; to my employer, the INSTITUTE FOR CLASSICAL STUDIES, University of Odense, directed by Professor SØREN SKOVGAARD JENSEN; to Professor OLAF PEDERSEN, INSTITUTE FOR THE HISTORY OF EXACT SCIENCES, University of Aarhus, who has kindly placed his materials and his wide knowledge at my disposal; to Professor EMMANUEL POULLE, ECOLE DES CHARTES, who gave me much useful information during a short stay in Paris; to Mr JØRGEN HASS, Dept. of Philosophy, Odense Univ., for proof-reading the Introduction and discussing it with me; to former and present inmates of the COLLEGIUM MEDICEUM, of whom Miss VIBEKE ØSTERGAARD KRISTENSEN has helped me with the French texts; and to Dr ERIK DAL, without whose gentle editorial help and persistence the edition would have left typescript even later than it did. For any errors of fact or judgment I bear the responsibility, as also for the drawings in the text except the initials on pp. 336-358, which were drawn by Mrs ANNI JEPPESEN, Odense.

Additions and corrections to this edition will appear in the *Cahiers de l'Institut du Moyen-Age grec et latin*, eventually to be summarized in the last volume of the *Corpus*.

Copenhagen, February 1983

PETRUS PHILOMENA DE DACIA.

§1. *Main features of the literature.*

Petrus (Philomena) de Dacia, or Petrus Dacus, canon in Roskilde about 1300 and the only Danish mathematician and astronomer of any repute during the Middle Ages, has had some attention since the invention of printing. Trithemius¹, correctly though incompletely, credited "Petrus de Dacia" with a book *de calculo seu computo*, a calendar, and a book of (astronomical) tables. From then until the late 19th century, several authors attempted to identify him with one or both of two contemporary Peters of Dacia (see §10a,c), on no other foundation than the coincidence of names. This story of conflation has been engagingly told by O.Pedersen² and need not be repeated here; in general, however, the problem persists. In modern times, besides a lot of notes on incidental discoveries, a few notable special studies have appeared. Thus, Gustav Eneström (1885;1886) indicated some manuscripts of the Calendar (which had been printed in 1880; see §3b), the lunar table (§3c), the commentary on Sacrobosco's *Algorismus* (§3a; printed by Curtze in 1897), and other pieces ascribed to one Peter of Dacia (§4c-e; §10b; Notes 13,32). Ernst Zinner published an expanded list of manuscripts in 1932(1936)³, and made suggestive comparisons with the works of William of St.Cloud and other contemporary astronomers. He also proposed that Peter Philomena was the author of two works edited in 1293/4 "a magistro Petro (Dane or Dano) de sancto Audomaro" (§11, §14). The certainly authentic treatise on an eclipse instrument, the *Eclipsorium*, discovered by Lynn Thorndike (1959; §3d), serves to corroborate earlier biographical findings (§8-9), and furnishes a basis for evaluating Zinner's conjecture just mentioned (§14). The most important recent contributions were made by Olaf Pedersen, notably in his survey of the whole subject (1976), which includes a list of manu-

1: Liber de scriptoribus ecclesiasticis, Basle 1494, 76v-77r, as cited by Eneström(1885,3)17 n.1 and O.Pedersen 1976,2.

2: 1976,2-5. Refs. also in Eneström (1885,3)17-8, cf. (1886,3)57.

3: The 1932 article is a Danish translation of a German original which was printed, unaltered, in 1936. In the sequel I cite from the latter.

scripts considerably extended by independent findings. The present edition proposes to continue this work.

§2. *Texts classed according to ascriptions.*

When taking into account the manuscript ascriptions, four classes of texts seem to demand separate consideration. (1) The texts consistently and reliably ascribed to "mag. Petrus de Dacia dictus Philomena", or some other form of the name including the surname, are the *Algorism-commentary* (*Exp. Alg.*); the *Calendar* with canons and the auxiliary moon-table (*T.L.*) plus its canon; and also the treatise of the *Eclipsorium*. These are all considered genuine, with some hesitation, however, concerning one of the canons to the *Calendar*, and are treated in §3. (2) The treatises ascribed to "Petrus de Dacia", which are suspect either for intrinsic reasons, or because the ascription is badly attested or alternates with ascriptions to other authors, are described in §4. These are considered unauthentic, but have been printed with one exception. (3) Some lesser anonymous pieces, mainly computistical and astrological ones adhering to the *Calendar* in later manuscripts, have been attributed to our author by modern writers, for reasons which the present editor considers inadequate. The commoner ones have been listed in Appendices 5 and 6 to the *Calendar*, and a few older ones in §5 below. (4) Of the treatises consistently bearing author's names which have been suggested as aliases of Peter Philomena, one lesser piece subscribed "frater Petrus Inguari studens Roskildensis" is printed at p. 562-3, if only for its shortness; cf. §10d. The treatises ascribed to Peter of St. Omer are discussed in §11 ff., and will be printed in Part 2 of this volume. As will appear, the present editor is inclined to reject this identification; but since the state of the problem is such that the reader should be allowed to judge for himself, and since these texts are worth printing in any event, it was decided to include them.

§3. *Summary of the evidence for the works supposed to be genuine.* The prefaces to the single works should be consulted for details.

(3a) *Expositio super algorismum* (*Exp. Alg.*). Literal commentary, with worked-out examples, on the *Algorism* of Sacrobosco. Printed earlier by Curtze (1897). A well attested subscription states that the work was

finished on July 31,1292⁴ "per magistrum Petrum de Dacia dictum Philomenam". No place is given, and one late and unconfirmed addition calling the author "bono comptotista in villa Parisiensi" should be regarded with caution (see Note 26). In an appendix to the treatise the author presents his own simplified method for extracting cube roots; the sources for this⁵, as for the treatise in general, remain unexplored. As a possible source I print a set of glosses on Sacrobosco, which present some textual parallels to our treatise without being obviously dependent on it⁶. For reference a text of the *Algorism* itself is also printed, as was done by Curtze. Except for the form of the treatise, which is typical for university instruction, and the fact that two passages, which may be commonplace, hint at the subject's connexion with astronomy⁷, nothing seems to indicate the applications intended.

(3b) *Kalendarium magistri Petri de Dacia* (*Calendar*: for the titles occurring in the manuscripts see *Preface* to that work, §10a). A version of it was printed in the Bibliotheca Casinensis, 1880, from ms. Mt (*Pref.* §2b). It has obviously been designed to supplant the common new-moon calendar of Robert Grosseteste (Beckman/Kålund 1914,XL, who were the first to distinguish between them on the basis of the numerical material); in fact, nearly all older manuscripts present it in surroundings very similar to that work (*Pref.* §6, §10b).

In most manuscripts the *Calendar* consists of 12 pages (one for each month) containing various calendrical sub-tables (each of them with room for 365 values) and accompanied by *canones*, as specified in this

4: Variant: "12901"=1291, in one ms., drawn on by Eneström (1885,8 p.65 with the reading "1290") and Curtze (1897,IX n.1, X). Accepted by O.Pedersen (e.g.1976,13) and others.

5: A query for the sources, by Eneström in *Bibl.Math.*3.F.14(1914)83-4, was apparently left unanswered. The method is said to be ultimately Indian (Rasch 1932,15, whence probably Jørgensen/Heegaard 1940,292); on the face of it, Sacrobosco's procedure is followed except for the fact that some of the trials are facilitated by using only the most significant figures. More refs. in O.Pedersen 1976,6 n.20-1.

6: Thus partly following a suggestion by Beckman/Kålund 1914, XXXIX n.2., to examine the glosses in Scandinavian manuscripts of the *Algorism* for earlier stages of the *Exp.Alg.* The possibilities are by no means exhausted: cf. *Algorism*, *Pref.* §1 and §4.

7: Form of treatise: Curtze 1897,IV; Rasch 1932,12. Astronomy: Curtze,XII.

section. Appended to all this one usually finds computistical tables with canons, notably the lunar table by our author, plus other matter (§3c below).

As concerns the month-pages, the only sub-table made by our author appears to be the table of mean conjunctions of the sun and moon for the 76 years 1293-1368 (*Pref.* §3). This is accompanied by one or two canons (*Kal.canon A/B*), the first of which is almost certainly authentic and modelled on a canon to Grosseteste's calendar; the other one rests on the same canon and apparently also on a rare canon to the table of Gerland (§5c below). These two canons only mention the table of conjunctions. However, besides that table and the frame-work meant to contain it and to make up the month-pages required in any calendar, many manuscripts exhibit varying selections of other calendrical sub-tables; the commonest of these, e.g. the table of day-lengths (§9), appear to have been taken over by some users from the calendar of William of St.Cloud, edited 1296. I print the two canons, the conjunction table mainly as re-calculated from the parameters (§21 below; *Pref.* §3), and for convenience, those other calendrical tables most commonly found.

The ascription to *mag. Petrus Philomena de Dacia*, or other forms containing the surname, is well enough attested (*Pref.* §10a). It is less certain when and where the work was composed. An auxiliary table in *Kal.canon B* begins with the date 1292, for purposes of reckoning; this is, then, the date of composition proposed by some of the less important manuscripts (*ibid.*) and also accepted, *i.a.*, by Duhem and O.Pedersen⁸. The oldest datable manuscript (*Pref.* §2b, ms.Re) appears to be from about 1304. There is also some evidence for the assumption that the work was originally released in Paris (*Pref.* §10a); in particular, the martyrologies of a notable group of manuscripts point to Paris or at least to Northern France (*Pref.* §13b). Further, two late witnesses state that the calendar was in fact calculated for the meridian of Paris; and an early addition to *Kal.canon A* says that new values for the Calendar can be found *per tabulas meas coniunctionum supra Parisius*⁹. This is, however, not confirmed from the values in the

8: Duhem IV,1916,30 "très certainement"; O.Pedersen 1968,4;1976,23.

9: Lost(*Pref.* §7a); ref. observed by O.Pedersen (1968,4;1974,540;1976,36). All three mss. in question read "meas". The value quoted as found in this way is tolerably consistent with those in the Calendar.

conjunction table: indeed, the times do not seem to have been calculated from any set of tables valid for Paris (see §21 below), but rather resemble those which could be obtained from the widely used Toledan Tables. See §8 for further discussion of dating and location.

The canons contain instructions for revising the conjunction table for use in the period 1369-1444 (*Pref.* §7a). Such a revised version, ascribed to himself by one Jo. de Palmis, appears in a few, mostly Swiss, manuscripts (*Pref.* §3), but the original version is also found in manuscripts written as late as the 16th century¹⁰.

(3c) Of the computistical and medical/astrological pieces which occur in varying selections as additions to the Calendar, probably the only authentic one is the *Tabula Petri Daci de loco lunae inveniendō*. . . (*T.L.*) This is a 14 × 12 table for finding the mean ecliptical longitude of the moon to within a degree, with a canon which presupposes the use of a calendar such as Peter's¹¹. The table is no doubt a revision of the early 12 × 12 lunar table, often found with Grosseteste's calendar. The *T.L.* with its canon are here printed together with the Calendar.

A summary of the other additional pieces is given in Appendices 4-6 to the *Calendar*. Since part of this material has been taken over from computistical collections centered around other calendars, Appendix 5(j) contains indications on calendars that may have yielded or received pieces commonly found with Peter's.

(3d) *Tractatus instrumenti eclipsium magistri Petri de Dacia (Eclipsorium)*. Construction and use of an instrument for computing eclipses. The treatise is known from two manuscripts, whose texts differ considerably; one text has been printed by myself (1978); the present edition reproduces the other one. Ascribed to *mag. Petrus de Dacia* or *Petrus*

10: I have found no conjunction tables whose values can have been revised for still another 76-year period on the lines indicated by the author. Cf. O.Pedersen 1968,6;1974,540;1976,22.

11: Eneström (1885,3)20,25-27 took Trithemius' attribution of the "calendar" and "tables" to mean that Peter was the author of a larger work on ecclesiastical computus, and found an example in a manuscript in French (*Calendar*, §2b, ms.Kt). The assumption was correctly rejected by Zinner (1936,321-2). A similar assertion is, however, still found in Bober 1948,16-17. *T.L.* belonging to Calendar: Zinner 1936,321;325. *T.L.* is sometimes styled "tabula medicorum" (O.Pedersen 1976,31; *Calendar*, *Pref.* §21), whence ultimately the putative "medizinische Arbeit" in Grabmann I,1926,128 n.48.

Dacus; for the surname see below. The manuscripts contain precession values derived from the *Almanach* of William of St. Cloud (1292), corresponding to the years 1297 and 1300 if William's own reckoning is used. The treatise is accompanied by the tables necessary to make it self-sufficient, among which are: (a) mean conjunction tables said to be valid for Paris¹² and in fact yielding results quite close to the values of William's *Almanach* (§21); (b) a *tabula portionis* appearing as a 59 × 59 multiplication table, ascribed to *mag. Petrus Philomena de Dacia*, and acknowledged by the author in the treatise¹³. Except for one obscure case, the rest of the tables are from the Toledan Tables, or transforms of them. One manuscript mentions the town of Roskilde, situating it 25 minutes of time to the East of Paris¹⁴. The constructional directions borrow their phraseology from the treatise of the Old Quadrant; and some features of the design could be thought to derive from the second version of Profatius' New Quadrant, from A.D.1301, if one is prepared to date our treatise as late as that. The canons to the tables mostly seem to be paraphrases of the commonly used *canones Azarchelis* to the Toledan Tables; some influence from the commentary on that work by John of Sicily (1290) may also be perceptible.

The works (3a-d) are all ascribed to *mag. Petrus de Dacia* (*dictus Philomena*) or *mag. Petrus Philomena de Dacia*, or simply *Petrus Dacus* (as it happens, never "Petrus Danus", which would be equally possible as ethnic). The characteristic surname is well attested for all the works. It is uncertain when and where the author got it¹⁵: it is seen to be attested from 1292, and in 1303 the Papal Curia still knew him to possess it (§9). Where the surname is missing, and there are no other points of comparison, the intention of the ascription must remain in doubt, as in some of the attempted attributions mentioned below.

12: Table-headings and text mentioning Paris: O.Pedersen 1976,34;36.

13: First discovered out of context (in ms. Vat.Reg.lat.1452, see *Eclipsorium*, *Pref.* §2) by Eneström (1885,3)21, and since then thought to be a separate work.

14: Roskilde: seen by O.Pedersen (1974,540;1976,34).

15: Uncertainty about surname: Jørgensen 1910,254. The name was translated into "Rosignol" by the Rennes-ms. of the Calendar (Jørgensen 1910,253; 254 n.2). Eneström (1885,3)27 and Zinner (1936,320) suggest that the

§4. *Uncertain and false ascriptions.*

(4a) *Declaratio super computum metricum manualem.* Paraphrasing commentary on the *computus metricus manualis* attributed to Anianus. Ascribed to *magister Petrus de Dacia*. Three manuscripts, all Italian from the 15th century; a mention of the 1320's in the text is not very well attested. The treatise seems to draw at least on Sacrobosco's *Computus* and Alexander de Villadei's *Massa Compoti*. One manuscript is intended for use in a Dominican environment; but generally the text is nondescript and apparently lacks features which might confirm the attribution to Peter Philomena. Thus, considering the age of the tradition, the authorship must remain in doubt.

(4b) *Demonstrationes magistri Petri Dace (hardly datae) super quadrantem.* On measurements of altitudes; possibly an extract from some *Geometria practica*. In one manuscript from the 15th century. The text has no distinctive features obvious to me.

(4c) The *Tabula planetarum secundum magistrum Petrum de Dacia, Parisius facta*, with a canon, and the *Expositiones signorum secundum praedictum magistrum Petrum de Dacia*, are transmitted by one English ms. of the 14th century (*Calendar*, App.6(b)) alongside with a lunar table and its canon, correctly attributed to our author. The table, on planets dominating the hours of each day, is common in some form in calendar works from the 14th century on; and the texts indicated are a close paraphrase of the anonymous moon-and-planet-book "Quicumque cursum lunae" frequently encountered.

epithet was caused by his occupation with lunar motions. In any case, the name *Naktergale* occurred in Denmark in the 15th century (Knudsen & all., *Danmarks gamle Personnavne* II,763). - "Philomena" is the title of a poem by Chrétien de Troyes, of two others attributed to John of Hoveden (Walther 17410, cf. T&K 1414 and Thorndike 1934,647 n.3; Chevalier, *Repert.Hymnol.* III,1904, no.23925), and of a medical work in 7 books (T&K 176=1355, one ms. from the 14th c.). The common "Philomena praevia" (Walther 14071, ?Jo. Peckham), by occurring in København N.k.S.134,4^o, caused J.W.S.Johnsson (1913,583) to assume that a preceding page of medical recipes was by Peter Philomena. - The assumption that the name "Philomena" somewhere attaches to Peter Philomena's writings rather than to the author (Eneström (1885,3)20, followed by Duhem 1916,29; Thorndike 1959,37 n.34) appears to rest on mis-readings by cataloguers, and on the fact that the word may be uninflected.

(4d) "*Calendarium magistri P. de Dacia*" is a contemporary index entry in a late 13th-century manuscript from France, which has been in Danish possession at least since the 16th century, now in Copenhagen. On the strength of the index entry, Langebek/Suhm (1786) printed extracts of the calendar, attributing it to Peter. However, in 1914 Beckman/Kålund showed that the calendar in question was Grosseteste's. Secondary notes in the calendar, in different hands and mentioning the years 1294 and 1295, show that the book was used by some Danes in Paris, probably at the University, about that time¹⁶. Langebek's opinion was that the manuscript had been in our author's possession: and Suhm supposed that he was the scribe of the secondary notes and the author of some of the works in the text-hand. The last assumption appears to be false, whereas the others cannot be as lightly dismissed.

(4e) The *Summa artis geometriae valde bona, edita a magistro Petro de Dacia* was brought to notice by Eneström; shortly after, the text was shown to be almost identical to the treatise attributed with certainty to Thomas Bradwardine¹⁷. I have not examined the texts further.

For some stray ascriptions of lunar tables other than the *T.L.*, see Appendices (4a) and (4c) to the *Calendar*.

This concludes the list of scientific and astrological works ascribed to one Petrus de Dacia. For further works see the discussion of our author's namesakes, §10 below.

§5. *Anonymous works, attempts at attributions.*

Some anonymous works have been attributed to our author in modern times, mainly because in some manuscripts they are found

16: Jørgensen 1923,420. Manuscript: København, K.B., N.k.S.275^a,4^o. For details and refs., see *Algorism, Pref.* §1.

17: Incipit "*Geometria assecutiva*" or "*Geometria est arismetrice*" (T&K 584(bis), 1548). Cf. Eneström (1885,3)26 no.3; (1885,8)67,69, both on ms. Vat.Ottob.lat.1389, from the 15th c.; further, Eneström (1886,3)59, on a ms. with this ascription bought by Boncompagni in 1885: this was written in 1365, consists of 85 leaves and has this text on ff.31-64. It does not appear in T&K. More refs. in O.Pedersen 1976,5 n.14-5. Bradwardine's authorship is asserted by Curtze 1897,III n.2 and Rasch 1932,15; Daly (*Manuscripta* 8(1964)11), on the Vatican ms., affirms that the work is largely identical with Bradwardine's.

with some of this authentic works, notably the *Calendar* and *T.L.* This is the case for some medical or astrological works¹⁸. As I shall try to show in the edition of the *Calendar*, hardly any of these are likely to have been transmitted alongside with the genuine works from a point where these were still under the author's control.

(5a) The old 12 × 12 lunar table has been confused with the *T.L.* both in the Middle Ages (Note 18 and *Calendar*, App.4(a)) and in modern times. For an ascription derived from this see Note 20.

(5b) *Tables of solar longitudes* for each day of 4 successive years, mostly with a table ascribed to Albattani and giving the solar declination for any longitude, are a standard accompaniment to the treatise of the Old Quadrant¹⁹. Dated versions, commonly beginning in 1292 or 1296, appear in this and other contexts (*Calendar*, App.5(g1)) and have sometimes been attributed to our author; in fact the values are those of the Almanach of William of St.Cloud²⁰.

(5c) One might for a moment consider the merits of the canon "*Theorica huius tabulae*" to the Tabula Gerlandi (text, *Calendar*, App.5(a3)). It has been found, *i.a.*, in three manuscripts of the *Calendar*, twice as secondary additions to fairly old copies. One of the versions includes a note showing that the text had been through the hands of someone connected with Jens Grand, arch-bishop of Lund during the 1290's. There is also some verbal similarity to the second canon to the *Calendar* (§3b). These, however, seem to be the only suggestive points.

18: cf., *e.g.*, Halliwell's attribution of the common sign-man (*Rara Mathematica*, 1841, p.117; *contra*, Eneström(1885,8)69; text, *Calendar*, App.6(d7)). The *computus ecclesiasticus* posited by Eneström, see Note 11. Attribution by Johnsson of a medical work, see Note 15; for some further, unpublished, notes by Johnsson, see O.Pedersen 1976, 32 n.40, and Note 39 below. A text on shadow-lengths connected to the *Calendar*, see *Calendar*, Pref. §2b, ms.N. Some confusion was caused by a secondary ascription of the old lunar table in a Munich ms. (*Calendar*, Pref. §2b, ms.M8).

19: Tannery 1922,147.

20: Attributions: Suhm *ap.* Langebek/Suhm VI,1786,260 (cf. O.Pedersen 1976,4-5), on the ms. mentioned in §4d above; Zinner 1925, no.3818 with p.428 (Wien, Oe.N.B., 2367, on the basis of a mistaken attribution of an anonymous lunar table). I have seen a pre-print of a paper by R.P.Mercier, treating of solar tables including the kinds mentioned here, and making the comparison with William. Cf. also *Calendar*, Pref. §17a and App.5(g1).

(5d) The anonymous defence of astrology "*In bono quod deus operatur*" is appended to a fairly old and textually independent copy of *Exp.Alg.* The text contains five *quaestiones* (ending abruptly), and mentions *studium Parisiense* in an example. The latest authority cited is Campanus of Novara (d.1296), and the manuscript does not seem to be later than the first quarter of the 14th century. There seems to be nothing but the place and date to connect the treatise with our author²¹. I have not examined it further.

§6. *Two texts by others, dependent on the Calendar.*

(6a) "*Ars istius tabulae lunae sequentis*", rubric to a lunar table with canon in ms.K of the Calendar (text: *Calendar*, App.4(b)). The day of conjunction is to be sought "in kalendario magistri P.de Dacia, qui magis appropinquat veritati", and the solar longitude "per tabulas quadrantis", *i.e.* a set of solar longitude tables (§5b): the set contained in this manuscript covers Jan.1296-Dec.1299.

(6b) "*Omnis creatura*" (text, *Calendar*, App.6(a)) is quite an extensive moon-and-planet-book found in the family of manuscripts where the Calendar has been up-dated for the years beginning with 1369. The text refers back to the Calendar, and was meant as a supplement to it; the author is a German.

§7-9. *Biographical evidence: Bologna, Paris, Roskilde.*

It may be repeated that Peter Philomena is only known from the period between 1292 and 1303²². He is never spoken of as a friar²³. As was seen (§3), there is sufficient evidence to connect him with the towns of Paris and Roskilde; this will be further discussed below.

21: I have used a transcription with full comments (1980, unpublished) kindly given to me by Mr. Søren Balle, Aarhus. Manuscript: München, BSB, Clm 14401, 180r-182v (text lost at end). Tentative attribution by the catalogue of Halm and Meyer, doubted by O.Pedersen (1963,4;1968,4;1976,47-48) and by S.Balle.

22: For the variant '1291' for '1292', see Note 4. No Peter Philomena occurs in the surviving excerpts of the Roskilde obituary (see §18); and if the extracts are fairly complete for this period (as is believed by Jørgensen 1933,195, cf. Sällström 1957,198), Peter might either have changed his

§7. There is also some reason to believe that our author was at *Bologna* in the beginning of the 1290's. Indeed, the protocol of the German Nation at the University of Bologna contains two entries on payments from "dominus Petrus de Dacia", made between Jan. 13,1292 and Feb.13,1293 (refs., §15). Some alternatives to our author have been suggested, including two Peters attested at Bologna in 1294, one or both of whom were probably students. Further, in a letter from the Dominican (Vice-)Provincial Hermann v.Minden to "Petro Daco" at Bologna, a text highly stylized, teeming with Scripture allusions concerning St.Peter the Apostle, and otherwise notable for its obscurity (text and refs., §16), the recipient is thanked for a "sphaera insperata" and another gift, probably a book; Hermann apparently excuses himself for some indeterminate kind of negligence; also, Petrus is invited to leave Italy and come to Germany. The letter is undated, and could be as early as the mid-eighties. Some of the allusions in the text do make it likely that the recipient had scientific interests. There is no sign of his status. Lastly, a work on astrology by one "magister Romanus", citizen and physician in Rome, was composed at the request of "mei magistri Petri Philomena canonici Rolkendensis" (text and refs., §17). The text yields neither dating nor location²⁴. Thus, at some point of time our author taught a subject connected with astrology to an Italian; and certainly, at the time and as concerns the universities, both the quadrivial arts and astrology are better attested for Bologna than e.g. for Paris²⁵.

surname after 1303 (possibility considered by Sällström p.197) or have died abroad (O.Pedersen, e.g. 1974,540;1976,8). The entries on one Peter of Dacia in the obituaries of St.Geneviève and of St.Germain-des-Près are, however, undated (Jørgensen 1914,346; cf. Zinner 1936,320-1).

23: Thus, if needed, one is safe in identifying "Dacia" with Denmark, not with the whole of Scandinavia (O.Pedersen 1963,6;1968,5; cf.1976,6; generally, Jørgensen 1914,345 n.2; 1933,194).

24: The dating by Thorndike (1934 p.648) to about 1300 seems to rest only on an attempted dating of Peter Philomena himself. Cf. §17 below.

25: Astrological/medical studies at Bologna: O.Pedersen 1963,7;1968,6; 1976,8; and the refs. cited there. On such studies at Paris, which may not have been negligible, see P.Kibre, *The Quadrivium in 13th century universities. . .=Actes du IV^e congr. int. de philos. méd.*(1967; Montreal 1969), 175-191; and R.Lemay, *The teaching of astronomy in medieval universities, =Manuscripta* 20(1976)197-217.

It must be admitted that the evidence is weak and only loosely connected. Our author's surname is absent from the two first sources just mentioned, whereas the subscription of the *Exp.Alg.* shows that he chose to use it within some months before or after the protocol entries. It is not impossible to assume that he obtained his degree while working up what may have been his old notes on Sacrobosco with a view to a teaching job at Bologna, and that he taught master Romanus in the sequel²⁶.

§8. It is certain that Peter stayed in *Paris* about the turn of the century or a few years before. This appears from the contents of the *Eclipsorium* (§3d) and, less reliably, from some sparse ascriptions of the *Calendar* (*Pref.* to that work, §10a) and of the *Exp.Alg.* (Note 26). On the other hand there is no external evidence of such a stay, and in particular none to prove or disprove a connection with the University. However, our author shares this fate with several Scandinavians likely to have been teachers during this period²⁷.

The time of Peter's stay in Paris is difficult to determine. The *Eclipsorium* is likely to be earlier than 1297/1300, and apparently later than 1292 when William published his *Almanach*. Since the *Calendar* seems to use a mistaken or out-moded set of parameters (§21), it may be earlier than the *Eclipsorium*. It starts with 1293, and there would be

26: Master's degree obtained, and lectures on the Algorithm, at Bologna: O.Pedersen 1968,5-6. The scribe's notes calling the author of the *Exp.Alg.* "bono comptista in villa Parisiensi" (*Exp.Alg., Pref.* §1, ms.S; Eneström (1885,3)19, Curtze 1897,VII) were earlier taken to locate that work, e.g. by Duhem 1916,26; the location at Paris is accepted by Beaujouan 1954,100, and by Kibre (cf. Note 25: p.183). The source value of the notes was doubted by Jørgensen 1933,194, in passing; O.Pedersen (1976,7) rejects them on the basis of the Bologna hypothesis.

27: The *liber procuratorum* of the English Nation at the University of Paris starts only in 1333 (Jørgensen 1910,255). Connection with the University was commonly assumed earlier, partly because our author was identified with the Paris rector of 1327 (§10c below); also, e.g., by Jørgensen (1933 p.194) without this premiss. Lehmann's assumption that Peter got his master's degree in Paris (1936 p.53) lacks confirmation (cf. preceding note). O.Pedersen (1963,7;1968,6), on the hypothesis that our author wrote the Paris works from 1293/4 ascribed to Petrus de S.Audomaro (§11) supposes that he would hardly have had time to teach as well.

no point in preparing it long before that year. Since the express datings to 1292 are not solidly founded (*Calendar, Pref. §10a*), one might allow for the possibility that it was made at a later date; a parallel case is William of St.Cloud, who had his *Kalendarium reginae* start with 1292, but did not publish it until 1296²⁸.

At that time William does not appear to have known of Peter's Calendar. The latter, like Grosseteste's, covered four 19-year cycles, whereas William's own contained only one. In his elaborate canon William makes the (seemingly unfulfilled) promise to extend his calendar²⁹:

Nolui autem ponere hic cyclum 76 annorum, qui positus est in kalendario Linconiensis - et continet quater istum - propter confusionem numerorum; sed si contingat me facere alia kalendaria ad alia climata, ponam alios cyclos in eis.

Thus, in 1296 or a little earlier, William took notice only of Grosseteste's calendar. Conversely, as was seen, Peter's Calendar takes no account of William's results from 1292, whereas our author did use some such values later. The simplest assumption, then, seems to be that Peter did not make his calendar in Paris, and that he arrived there rather late; but this is far from conclusive, and the Paris conjunction-tables alleged by the addition to Peter's first canon are a stumbling-block in any event.

§9. When writing in Paris, Peter already had some kind of connection with the town of *Roskilde*, since one ms. of the *Eclipsorium* mentions that city as situated 25 minutes of time to the East of Paris³⁰. A papal letter of July 4, 1303, concerning a matter which appears irrelevant (text and refs., §19a), is addressed to "Petro Philomenae canonico Roskildensi" together with two other Danish clerics of high standing; a repetition of that message, of Nov.22,1303 (§19b), has exchanged two of the addressees, including our author, with two others. The only safe conclusion is the obvious one that in mid-1303 Peter was known at the Curia as a canon of Roskilde. That title also occurs in the undated treatise by magister Romanus (see §7).

28: Other examples of calendars conventionally starting at boundaries of 19-year cycles: North II,1976,101.

29: Harper 1966, p.118,cf.p.33. The present text from ms. Erlangen 434,5ra.

30: O.Pedersen 1976,34; see §18a.

Thus in any case one may suppose Peter to have come from Roskilde. If the Papal Curia was properly informed in 1303, he was back by then, with the status of canon at the Cathedral Chapter. If he met Romanus in the meantime, he was a canon before his return, and if in the early 1290's, probably before he went abroad.

Peter's early connexion with the Chapter of Roskilde appears to be confirmed by the likelihood that he knew the value for Roskilde's geographical longitude which, probably in 1274, had been used in the obituary of that Chapter (text and refs., §18a). Indeed, the *Eclipsorium* passage mentioned above may have used this value together with a longitude for Paris which is, at least, documented as one of those used at the time. From another fragment of the Roskilde obituary, which is the one actually dated to 1274, one also learns that the book contained day-by-day tables of solar altitudes and ecliptical longitudes, and of day-lengths, occurring in connexion with a calendar or separately (§18b). Since some such tables (for the latitude of Paris) were also calculated by William of St. Cloud for his calendar edited in 1296 (cf. *Calendar, Pref. §15-17*), it has been suggested³¹ that William owed the idea for this innovation to Peter. But as was seen above (§8), it is hard to assume any connexion between them at that time. Further, with one exception the tables actually occurring in some manuscripts of Peter's own Calendar are likely to have been taken over from William's calendar or Almanach³². Because of this state of the evidence, the assumption that Peter influenced William must, regretfully, still be considered unverified. Nor is there any means to confirm Bjørnbo's assumption (§18) that Peter himself was the originator of the Roskilde data.

§10. Namesakes of Petrus Philomena.

The following list contains some of our author's namesakes who were his near-contemporaries and have been identified with him occasionally³³. See also §11 ff. and Note 22.

(10a) *fr. Petrus de Dacia*, from Gotland, in the Dominican order from about 1240; studies at Cologne and Paris 1266-70; died 1289 as

31: Zinner 1936,327-8; cf. O.Pedersen 1968,7;1976,10.

32: Thus Zinner 1936,325. O.Pedersen (1968,6;1976,24) suggests that Peter introduced these features into his calendar from the beginning. As noted

prior of the convent at Visby. Biographer of Christina of Stommeln³⁴. The confusion with our author is early³⁵.

(10b) *mag. Petrus de Dacia*, author of two University sermons from Paris, and one *prothema*, between 1268 and 1275³⁶.

(10c) *mag. Petrus de Dacia, canonicus Ripensis*, rector of the University of Paris in 1327. He is probably the same as either "mag. Petrus dictus Wint(er) de Dacia" or "(mag.) Petrus Strangonis de Dacia", both mentioned in a document from 1332-3³⁷. Identification with Peter Philomena early, but unlikely for reasons of chronology³⁸.

by Eneström (1885,3)25 no.17, one manuscript contains a separate day-length table ascribed to Peter (*Calendar, Pref. §16*). This, like a shorter table with the same ascription, must be an extract from the Calendar.

33: List: mainly as in Zinner 1936,320-1.

34: Th.Kaeppli, *Scriptores O.P. medii Aevi III*,1980, p.224-5(no.3225) with refs.

35: Refs., see Note 2. This identification still in Thorndike 1934,647-8.

36: Kaeppli (see note 34) p.225 no.3226-8. Edition: H.Roos, =*Classica et Mediaevalia, Dissertationes IX*,1973,470-95; *id.*, =*Lumen* 49(Jan.1974)20-42, with introductions and refs. Dating: Roos, *op.cit.*(1973) p. 481-2, with refs. Attributions etc.: One ref. in Eneström ((1885,3)26;(1885,8)68), from Montfaucon, whence Jørgensen 1910,261. Jørgensen 1933 p.195 rejects attribution to Peter Philomena; *contra*, Sällström 1957,198-9, by general considerations only. Lehmann (1936,47) and O.Pedersen (1963,4) suggest the Dominican (above), and Kaeppli makes that identification. Roos, *op.cit.*(1973)480 rejects both attributions, since the Dominican was probably never a master of theology; neither is Peter Philomena known as such, and also his active period seems to have fallen somewhat later.

37: The rectorate: *Chart. Univ. Paris. II*,1(1891) p.300-1 no.863 (a.1327); for the title of *magister* see also *ibid.* p.300, note to no.861. "Petrus dictus Wint(?er) de Dacia" and "Petrus Strangonis", masters in the English Nation: *op.cit.* p.406 no.955 (a.1332-3). "Petrus Strangonis": *op.cit.* p.664a no.1184 (a.1329-1336). "Petrus Strangonis de Dacia" as *magister*: *Chart. Univ. Paris., Auct. I*(1894) col.16 lin.4 (=Liber procuratorum nat. Angl., a.1333); "sub magistro Petro de Dacia": *ibid.*, col.18 lin.4. I suppose he could be the "Petrus Strangonis f.", master of philosophy and *cantor* in Roskilde, who died there on Aug.16,1343; a homonymous Canon died in 1366 (Otto 1933,76,82, with refs.). I have not checked the statement by Bulaeus (*tom. 4* p.982: *ap. Langebek/Suhm VI*, 1786,260 and Eneström(1885,3)19) that the Paris rector was still alive in 1347.

38: Still by Eneström (1885,3)19-20. Suggestion about P.Strangonis/P.Winter: Curtze 1897,X (cf. H.G.Zeuthen/Gertz/Erslev in *Oversigt over Det Kgl. Dan. Vid. Selsk. Forh.* 1896, p.79), and later authors. The objection seems to

(10d) *fr. Petrus Inguari studens Roskildensis*, scribe or possibly inventor of a *rota* for finding the moon's position, in a 14/15th-century Copenhagen manuscript (text, p. 560 ff.)³⁹. Since he was a friar, he can be left out of consideration⁴⁰.

(10e) *mag. Petrus Alexandri archidiaconus Roskildensis, decretorum doctor* was *regens in decretis* at the University of Paris in 1312. He must be the same as "magister P.Foot huius ecclesiae archidiaconus et magister in decretis", who died in 1313 according to the Roskilde obituary⁴¹. Time and place fit very well, but confirmation is lacking.

be only chronological; at least, Thorndike's extra argument against identification with Peter Philomena (1934 p.647-8, *via* an identification with the Dominican: "since that post (*sc.* as rector) was held by a student") is wrong on any account.

39: Held to be the same as Peter Philomena by J.W.S.Johnsson (manuscript notes, København, Kgl.Bibl.,Add.1221,4^o, ref. from O.Pedersen 1976, 32 n.40; some notes also included with ms.Add.447,2^o), followed by Sarton II (1931) p.997. One "Petrus Inguari praepositus Roskildensis" died at Sep.28,1241 (Otto 1933,46), but our text can hardly be as early as that.

40: O.Pedersen 1976,48.

41: From Sällström 1957,197-8;200. *Petrus Alexandri: Dipl.Dan.*, 2.Rk.6 p.350-1 no.439 (papal letter of July 22,1312). P.Foot: *Liber daticus Roskildensis*, Otto 1933 p.65 (July 24,1313; place of death not stated). See Sällström, *l.c.*, for some less likely identifications with Roskilde clerics.

PETRUS DE SANCTO AUDOMARO.

§11. *Works from 1293/4.*

Petrus (?*Danus*) *de sancto Audomaro* is the author's name connected with the three astronomical works to be printed in Part 2 of this volume. Two of these were written in 1293-4, probably in Paris; the third (see §12a) appears to be later than 1300 and probably unauthentic. The early works are as follows:

(11a) *Novus quadrans correctus a Petro Dane de Sancto Audomaro* (*Quadrans 1*) "Quoniam conceditur". Description and use of the New Quadrant which had been invented by Profatius Iudaeus (Jacob ben Mahir) and described by him in 1288⁴². Not published earlier. The surname "Dane" (with the less certain variant "Dano") is quite well attested; it means 'from Denmark', and one 15/16th-century attribution to "Petrus de Dacia" exists, though not connected with our treatise (§20). The treatise refers to "in hoc tempore quo computantur anni ab incarnatione Christi 1293", thus 1293 or 1294⁴³. A few manuscripts locate it to Paris. This is confirmed by the use of the precession value of 10°;14 for the year mentioned, obviously from William of St. Cloud's *Almanach*⁴⁴, although about 2 minutes too small on William's own reckoning. The first part of the treatise contains detailed directions for constructing the instrument; this seems to be the first longer text of its kind⁴⁵, and may be original. The two remaining parts are extended transcripts of, respectively, Profatius' chapter on astronomical uses, and of the section on terrestrial uses from the treatise of the Old Quadrant⁴⁶. I have found no important external references.

42: Translated from Hebrew into Latin in 1291. See Preface to the *Quadrans 1* for the early publication history of the various treatises on the New Quadrant, and generally Poulle 1964.

43: The dating to 1309, by the scribe of the Venezia manuscript M, was apparently first observed by Meyer (1898 p.575); it persists in the works by Glorieux and is there attached to the *Quadrans 2* (§12). The correct dating was given by Zinner (1936,320) and by Thorndike (1960).

44: Noted by Zinner (1936,326). A less well-attested variant is 10°;10. This may be a scribal error, but see Note 48.

45: Zinner 1936,326.

(11b) *Tractatus de semissis (Semissa)* "Quoniam non conceditur". Construction and use of an instrument, invented by the author, for finding planetary longitudes; with several appendices on calculation of planetary conjunctions and latitudes, eclipses, etc. The instrument was re-constructed by Olaf Pedersen (1963;1968) and the text edited by myself (1979); that text will be reproduced in Part 2, with a few corrections and the same paragraphing. Ascribed to *mag. Petrus de sancto Audomaro*. The text refers to "in tempore nostro quo computantur anni ab incarnatione D.N.J.C. 1293 perfecti", thus probably the same year as the *Quadrans 1*. The author also refers back to that work as his own⁴⁷, a fact which confirms the attribution but also seems to explain why some later British sources, mostly unconnected with the text itself, attribute it to Profatius. The location to Paris can be assumed as certain, partly from the use of the Toulouse Tables of mean motions, partly from the dependence on William of St.Cloud's results in his *Almanach*, namely, the corrections to the Toulouse Tables and the (rounded?) value of 10°;10 for the precession⁴⁸. The rest of the tables presupposed or appended are mostly Toledan or, for planetary latitudes, those of Albattani; one table, for the equation of time, was calculated by the author, but is lost except for some values cited in the text. As for the text itself, the directions for the tables are transcripts of the common canons, notably the *Canones Azarchelis* and Albattani; as was seen, the author also knew William's *Almanach*; further, he used the *Theorica Planetarum*, though apparently not Ptolemy.

46: Poulle 1964,196-7. The relevant section of the *Quadrans 1* was used as an auxiliary witness for Profatius' text by Lydik Garm in his edition of the latter (thesis, Aarhus 1966; cf. O.Pedersen 1976, 44 n.48). Old *Quadrant*, see Note 19.

47: Dating and ref.to the *Quadrans 1*: Thorndike 1960, cf. O.Pedersen 1976, 40 and 44-5. The double dating makes it hard to share Poulle's (1964,194-5) skepticism about accepting 1293(/4) as the precise date.

48: Paris: apparently unconfirmed by the variant reading *Parisius* for *praecisus* at §2,21 of the text (contrast O.Pedersen 1976,40). Dependence on William: Zinner 1936,326-7. Value of precession adapted to yield a round value for the solar apogee: Poulle 1980,209. The genesis of that value is, however, uncertain, cf. Note 44.

§12. *Dubious works.*

(12a) The *Ars et operatio novi quadrantis editi a magistro Profatio Marsiliensi . . . et postea a Petro de sancto Adomaro Parisius diligenter correcti et perfecti* (*Quadrans 2*) has the same general content as *Quadrans 1*, but some changes of the instrument have been introduced in accordance with Profatius' revised *Quadrant* treatise of 1301. The text has not been printed earlier. This was the first treatise known to carry the name of Peter of St.Omer; and thus he was unquestioningly accepted as the author/editor until our text could be compared to the *Quadrans 1* and *Semissa*. One is then left in doubt about all its circumstances⁴⁹. It does not use William's precession value⁵⁰, but presents a table, beginning A.D.1300, with the old values from the Toledan Tables. The remaining tables incorporated in the text are also mostly from that source. A solar table, lost, was valid for the year 1300. As a *terminus ante*, one preserved stellar table is dated to 1316, and another one (lost; traces in one lesser manuscript) is dated to the same year and located to Oxford. In fact, the significant part of the manuscript tradition is English. All taken together, the treatise must have been intended for use at a place where the Toledan Tables, and possibly Profatius' *Almanach* (1300), with their parameters, were the only ones current. Thus, since the title quoted above does not in fact refer to Peter of St.Omer as the author, the attribution should be left in doubt⁵¹. However, in passages our text does appear to be a revision of the *Quadrans 1* rather than of either of Profatius' treatises.

(12b) The treatise "*Cuilibet planetarum assignatur triplex locus*", following the *Semissa* in one manuscript, was casually attributed to our author by Thorndike⁵². Its explicit, as reported by Thorndike, looks like that of the *Theorica Planetarum*. I have not examined the text further.

49: Noted: by Renan 1877,612-3. Doubt expressed already by Zinner (1936,326).

50: Poulle 1964,195; for the *terminus ante* of 1316 mentioned below, *ibid.*p. 95,109.

51: Poulle 1964,209 n.63.

52: Thorndike 1960, from Basel F.III.25,17r-26r. I have seen 17r, which is in a different hand from the *Semissa* preceding. (Upper mg.): Incipit quoddam praeambulum de theorica planetarum. (Txt:): Cuilibet. (=T&K 275, with

§13. *Two suggested identifications.*

Two persons by the name of Petrus de S.Audomaro are known from the period. One *mag. Petrus de S.Audemaro* is given as the author of a *liber de coloribus faciendis*, in one 15th-century manuscript. The text has been dated to the 13th or 14th century from its contents. Nothing further is known of the author⁵³.

The other *mag. Petrus de S.Audomaro* is well attested from external sources as a master of theology at the University of Paris, between 1289 and 1308. Since the biographical evidence may not be readily accessible⁵⁴, I recapitulate it here; the references are mainly from Glorieux.

"Mag. Petrus de sancto Audemaro" is a master of theology in 1289, taxing houses in Paris together with some other masters of theology and of arts⁵⁵. From about 1290-1, some *quodlibeta* by "p. de sancto odomaro" occur in the collection of Nicolas de Bar, examined by Glorieux. Thus he was *actu regens* then and in 1297-9⁵⁶. On June 17, 1296, a bull of Boniface VIII to "magistro (Petro) de sancto Adomaro cancellario Parisiensi", also "canonico Parisiensi", appoints him to the post as Chancellor at the Notre-Dame⁵⁷. In that capacity,

three further mss.; anonymous). ..(*explicit*, Thorndike) *vinci lumine ipsi planete et non corporaliter* (cf., e.g., ms. København K.B., Add.447,2^o, 56rb).

53: Cited in this connexion, and identification rejected, by Meyer 1898,575. Edition by L.van Acker, = *Corpus Christianorum, Cont. Med. XXV*; esp. p.145-6, 165-6. - J.M. de Smet (= *Miscellanea historica in hon. L.van der Essen I*(1947), 240 f., as cited by van Acker 165) separates this author both from Petrus Pictor, Canon of St.Omer (*fl.c.*1110) and from the Paris theologian below.

54: Some data by Hauréau, *H.L.F. XXV*(1869)319; and by Meyer 1898,574-5, whence Zinner 1936,320. Most detailed by Glorieux 1928,223-5 (biographical sources, *quodlibeta* with datings); *id.*1935,222-3 (recap. of biography, list of *quodlibeta*); *id.*1966,246.294.324 (donations to the Sorbonne; cf. Note 65).

55: Denifle/Chatelain, *Chartularium Universitatis Parisiensis* II,1 (1891) (= *C.U.P.*) no.556 p.30 (citing also Jourdain, *Index* no.293). One of the masters of theology, Jo. de Murro, did not yet have that title by Dec.31,1288 (*C.U.P.* p.32 n.38); thus the date here given, "1288", must mean 1289 before Easter, on our reckoning (*ibid.*). Glorieux supposes that Peter had obtained his title recently, apparently on the analogy with Jo. de Murro (1928,223).

56: Glorieux 1928,202;208-9;223-5, with the dating; *id.*1935,222-3. The manuscript is Par.lat.15850.

57: *C.U.P.* no.595 p.69-71.

at Aug.30, 1296, "magister Petrus de sancto Audomaro, cancellarius Parisiensis" receives some theological books on behalf of the Chapter of Notre-Dame, to be lent to theological students at the University⁵⁸; and in Sep.1297, "praedictus magister Petrus cancellarius" arranges a similar matter⁵⁹. About 1297-8 and 1298-9, two sets of *quodlibeta* are again attested, by "domino petro cancellario de audomaro" and "magistro p. de s. au. can."⁶⁰. The appeal to the Pope, of Oct.12, 1300, by Arnaldus of Villanova, concerned a case against the University which was "actum--coram--cancellario ecclesiae Parisiensis" (no name)⁶¹. On Dec.5, 1301, a Papal letter addressed, *i.a.*, to "cancellario ecclesiae Parisiensis" (name blank), accompanies another contemporaneous letter summoning the French doctors of theology and masters of Canon and Civil Law, "tam actu regentes Parisius quam non regentes", to the Pope before next November. The former letter enjoins upon the Chancellor and two others to see to it that enough teachers remain in Paris at any time; and the Chancellor himself is summoned⁶². On July 30 and Aug.10, 1302, a donation to the Chapter of Paris is recorded "a...magistro Petro de Sancto Audomaro, archidiacono Brie in ecclesia Parisiensi"; he is no longer mentioned as Chancellor⁶³. Finally, in 1308, Mar.25, the seal of "magistri P(etri) de s.Audomaro" was among those affixed to the answer to Philip IV on the measures against the Templars, given by a college of masters of theology "tam actu regentes quam non regentes"⁶⁴. Four books were bequeathed to the Small Library of the Sorbonne "ex legato magistri Petri de sancto Odomaro", and catalogued between 1310 and 1338⁶⁵.

58: Delisle III(1881) p.3 no.3, *cf.id.*I(1868) p.427 n.1. From Guérard, *Cartulaire de l'Eglise Notre-Dame de Paris* (1850), III p.349. Cf. *C.U.P.* no.598 p.72.

Source: the *Livre Noir*, cf. Guérard, *op.cit.* I p.III-IV.

59: Delisle, *op.cit.* p.4 no.4. From Guérard, *op.cit.* III,350.

60: See Note 56. Same source, dating by Glorieux.

61: *C.U.P.* no.616 p.89-90.

62: *C.U.P.* no.622 p.93-4, cf. no.621 p.93.

63: Guérard (Note 58 above) II,524 (July 30; from the *Magnum Pastorale*, cf. Guérard I p.II-III; the print includes a summary and a short extract of the text). Guérard, *op.cit.* IV,129 (Aug.10; from the obituary of the Notre-Dame; contains the title quoted). Both concern the same donation. Cf. *C.U.P.* no.595 not., p.70-1, also for the fact that at July 8,1303, someone else was Chancellor at the Notre-Dame.

64: *C.U.P.*, no.664 not., p.127. Faint inscription on a seal-band, read by Denifle/Chatelain with the aid of other testimonies.

65: Delisle III(1881) p.28-9 (=Catalogue of 1338, XXIII,98-100;104). Three volumes remain as Par.lat.15764,15774,15792 (Delisle, *ibid.*, and II(1874) p.169) with parts of St.Thomas' Sentences commentary. They do not seem to show notes indicative of specialized scientific interests in any possessor, nor could this be expected. For the time of cataloguing see Rouse, =*Scriptorium* XX(1967)243, in preference to Glorieux 1966.

These references (with the possible exception of the anonymous ones from 1300-1) constitute quite a coherent picture of one person. There is no sign of any scientific activity of his, nor is he given any surname; thus his connection with the astronomical treatises is not specifically confirmed nor refuted⁶⁶.

§14. *Attempts at identification with Petrus Philomena.*

Zinner⁶⁷ radically conjectured that the name *Petrus (?Danus) de S.Audomaro*, author of the *Quadrans 1* and the *Semissa*, was an alias of Peter Philomena. If so, this alias only appears to have been preserved in connexion with the texts mentioned and with the *Quadrans 2*, not in the sources cited in §13 nor in any other independent ones. It may also be noted that the works in §3 and §11 do not show overlapping ascriptions⁶⁸. Zinner's argument seems to be the following: (a) the two Peters of St.Omer known from elsewhere (§13) can be discounted as authors of astronomical works, on the token of their known activity⁶⁹; (b) Petrus Danus de S.Audomaro must be a Dane because of the surname; (c) he was active in Paris in 1293(/4), together with Peter Philomena, whose Calendar would be from about 1292. In fact, (a) has numerous counter-examples; (b) in the works accepted as authentic, Peter Philomena is never called "Danus", but the synonymous "Dacus" is used; further, the name in question is most safely attested as the ablative "Dane", which may be either an ethnic or, at least later in the 14th century, a Northern French surname⁷⁰. (c) is mainly true.

If the hypothesis of identity is assumed, one gets this chronology:

66: Identification accepted (even if concerning the *Quadrans 2*) by Renan 1877,613; also by Glorieux (1928 p.224, and later). Doubted, on account of his activity as a theologian, by Meyer 1898,575, cf. Note 69.

67: 1936 p.320.

68: One exception, see §20 and §11a. Names distinct in one and the same manuscript: Thorndike 1959,p.37-8.

69: Zinner, *ibid.*, following Meyer 1898,575.

70: Ethnic: Martinus Danes (†1304, in the Notre-Dame obituary from 1529: Jørgensen 1914,342). Surname: Guido Danes, diocese of Théroutanne (arr. St.-Omer), in the Picardian nation at the University of Paris in 1362-79 (*Chart. Univ. Paris.* III(1894) p.86,130,261). But generally these forms are uninflected.

<i>Exp. Alg.</i>	P.de Dacia dictus Philomena	1292	?
<i>Calendar</i>	P.Philomena de Dacia (<i>ca.</i>)	c.1292	Paris?
<i>Quadrans 1</i>	P."Dane" de S.Audomaro	1293/4	Paris
<i>Semissa</i>	P.de S.Audomaro	1293/4	Paris
<i>Eclipsorium</i>	P.de Dacia/P.Dacus	c.1300?	Paris (ref.to
<i>Tab.port.</i>	P.Philomena de Dacia		Roskilde)
(Papal letter)	P.Philomena can.Rosk.	1303	Roskilde

Comments: Since the *Calendar* does not use William of St.Cloud, it must be earlier than the *Quadrans 1*. Then possibly William chose to ignore the *Calendar* in 1296 (§8) whereas Peter knew William's work by then. The *tabula portionis* in the *Eclipsorium* is later than the *Semissa*, or it would surely have been mentioned on numerous occasions in the eclipse section of the latter work. (Conversely, Peter's own table of the equation of time, in the *Semissa*, is unknown or ignored by the *Eclipsorium*.) The source of the name used in the Papal letter may, of course, be as old as Peter's canonicate.

Such an alternation of aliases may not be impossible, but can be acknowledged only if its cause is demonstrated. No documentation of such a cause has yet been offered⁷¹.

The hypothesis might still be tenable if the texts in question showed significant similarities about doctrines which were in any case controversial⁷². The two texts which can be compared in this respect seem to be the eclipse sections of the *Semissa* and the *Eclipsorium*, and more particularly, the sections on parallax computation. It is at least true that discrepancies occur, as follows⁷³: (a) The *Eclipsorium*, like the *canones Azarchelis*, treats the parallax table as if it supposes the moon to be at mean distance; whereas the *Semissa*, like e.g. Albattani, takes the moon to be at its apogee for that purpose⁷⁴. At two further points the manuscripts of the *Semissa* itself are divided: (b) In correcting the parallax for the moon's position on the epicycle, the *Eclipsorium* uses a wrong table for the interpolation function. Part of the *Semissa* manuscripts are at least not explicit as to which table to use, whereas the rest of them expressly identify the correct table, apparently in an added passage⁷⁵. (c)

71: O.Pedersen 1974,541. O.Pedersen (1963,7) supposed that Peter might have had a prebend in St.Omer while staying at Paris. It may yet be possible to verify this.

72: The preambles of the *Semissa* and *Eclipsorium*, compared by O.Pedersen (1976,49), both appear to consist of commonplaces: cf. *Eclipsorium*, Pref. §7.

73: F.S.Pedersen 1978,82-4; 1979,103-5.

74: *Ecl.* § §73,109,122; *Sem.* 10,19;10,22.

75: *Ecl.* § §54,73,114; *Sem.* 10,22.

The *Eclipsorium*, and the first set of *Semissa* manuscripts just mentioned, suppose that the sign of the parallax in longitude changes when the moon is in the meridian; whereas the remaining *Semissa* manuscripts have the correct doctrine that the sign changes at 90° from the ascendent⁷⁶.

Some *ad-hoc* explanations may be found, *e.g.* an assumption that the *Semissa* has undergone a revision, at a date later than the edition of the *Eclipsorium*, or by someone else. Again, as the matter stands, this cannot be verified. On the assumption of identical authors, one may also wonder why the author did not use his own earlier wording in the instructions for parallax computation, since some passages of the *Semissa* show that he was not averse to *verbatim* transcriptions from other authors.

Thus, when taking into account the *Eclipsorium*, which was unknown to Zinner, so much can be said against his hypothesis that one is by now obliged to exact some kind of significant positive evidence from those who would uphold that identification. Until then, one may content oneself with accepting the theologian Peter of St.Omer (§13) as the author of the *Quadrans 1* and the *Semissa*.

76: *Ecl.* §§79,110; *Sem.* 10,24;10,26-7;10,30.

APPENDICES.

§15. (a) *Acta nationis Germanicae universitatis Bononiensis*, ed. Friedländer/Malagola, 1887, p.40a, l.19-20. Jørgensen 1910,255. Lehmann 1936,54. Sällström 1957,151; 193-200 (with full discussion of the possible identifications, cf. §10e above). O.Pedersen 1963,5-6;1968,5; 1974,540;1976,7.

Two adjacent entries in the register of the German Nation at the University, in a series of entries under the date of January 13, 1292; the present entries were made by a successor to one of the *procuratores* elected at that date, and before February 13, 1293.

Item dominus Petrus de Dacia XII solidos.

Item dominus Petrus de Dacia VI solidos.

(15b) Bologna, Archivio di Stato, Memoriali del comune Bolognese vol.86, 370v. From Sällström 1957,163,187; cf. 126-7 (source identification), 193-4,200 (identification of persons).

At March 30, 1294, one "dominus petrus dictus albus de gumbergiis de dalcia (= "dascia", surely) *scolaris bononie*" receives a sum from three Pistoia bankers; through a partner of theirs, the sum had been paid in "a magistro johanne de dalcia parisius". Among the witnesses are the Danes "domino petro de skelfiscor et domino johanne de borlem de dalcia".

Sällström suggests that the two Peters here found, and those from the register entries §15a, are the same, and/or identical to Peter Philomena or Petrus Alexandri (§10e), in some combination. At least, Bolognese sources from the period show no Danish Peters except the four here recorded and one "Petrus Abii de Dacia" in the register from 1296.

§16. *Letter of Hermann v. Minden.*

Berlin, Staatsbibl. preussischer Kulturbesitz, theol.lat.oct.109, 43r(=2r, old fol.). From the collection at Berlin, Kgl.Bibl. (now Deutsche Staatsbibl.). Vellum, ff.202, ca.14 × ca.10. Late 13th c. Contains copies of letters from Dominicans written between 1264 and the 1290's (Finke (below) p.7,9), in different hands, mainly in chronological order, and meant to serve as formular letters.

Rose II,2(1903) p.801 no.773. Finke 1891,6-8, 26 (description of ms.; sample of text). Schüek I,1896,80-1=*id.* I³,1926,343. Jørgensen 1914,345 n.2. Lehmann 1936,53-4 (sample of text, with discussion). Jørgensen/Heegaard 1940,291. Sällström 1957,196. O.Pedersen 1963,5;1968,5;1974,540;1976,8.

A description, and some readings used below, were kindly furnished by Dr. Gerard Achten, Berlin. I have had the benefit of using an independent transcription by Dr. Jørgen Raasted, Copenhagen, who has also helped me with single readings and Scripture quotations.

Hermann v.Minden was Dominican vice-Provincial "super Rhenum" *ca.*1278; in Paris 1286; Provincial of the German Province 1286-90; Vicar of the Provincial until 1294 where he disappears from the sources (Finke 27-8,42). The present letter is undated. Finke (6-7) dated it before 1286, since it occurs together with another letter by Hermann from 1277-81, and possibly since the recipient was thought to be Peter the Dominican (§10a above; Finke p.26 n.2), an assumption shared by Schüek. From the mathematical and computational allusions Jørgensen and Lehmann proposed Peter Philomena as addressee, Lehmann adding that there is no other evidence to show that Peter the Dominican had been to Italy. The formula "amicus amico", adduced by Lehmann as an unlikely way for Hermann to address an inferior Dominican, might in fact be an addition by the compiler of the letter-collection (Achten); still, "amico" occurs in the text as well. Thus, on Finke's dating, this may be our earliest evidence of Peter Philomena; or the letter could be dated as late as 1294.

In the text below, the punctuation is mine; orthography is respected except for u/v, ci/ti, and capital letters. The identifiable Scripture allusions are italicized and furnished with references.

(upper right, partly cut away:) H(er)man(us).

(Text-hand:)

Amicus amico. A deo dato Petro Daco, is cuius interpretatio nominis boni est prelibatio ominis, anathema meroris, quicquid est honoris. Cum vester Thobias sine lumine gaudii residerem (*cf. Tob. 5, 12*), tempusque recurrentis baiuli, quod pater in sua potestate posuit, sollicitis articulis computarem, tandem apparuit bonus de Bononia nuntius, munera deferens, et de amico salvo salutes referens (*cf. Tob. 10, 1.8.9.*), muneribus gratiores. Accepi primum speram insperatam, que dignam sibi cito laudem preripuit, quia opus

materiam superavit; sed cum ad rem miram sim Bernardus ad lyram, «et» nesciam¹ distinguere cum Thalete tempora, [[cum]] investigare cum Atlante sidera, cum Crisippo² extrahere numeros, cum Euclide connicere modulos, ipsa ad usum largientis provide conservata *descendi ad areolam aromatum* (*Cant. 6, 1*) quam misistis. *Omnem ibi pretiosam substantiam repperi* (*Prov. 1, 13*), sed continuit olfactus, abstinuĭt gustus, solum argute lustrabat oculus, donec nudaretur locus, de quo radiaret titulus, qui latentem energiam proderet, de abditis littera cum prodiret. Porro †inuenente† prologus miseriarum videbatur epilogus, quas in *statera mentis* qui *appenderet*, *arena maris vix gravior appareret* (*Iob 6, 2-3*): *angustus animo, afflicto corpore, spe distentus, redemptionem non suscipiens, circuire in melotis et caprinis pellibus* (*Hebr. 11, 35. 37*), quam hiis *subesse sentibus* (*Iob 30, 7*), potius elegisset. Quis digne pensare dignetur, cum egritudine cronica langueret dominus, [[et]] «. . . ut» *videret finem a longe sequeretur Petrus* (*Mt. 26, 58*), quomodo «de» illius fine factus est *funis*, levans in eculis, qui ante vobis *ceciderat in preclaris* (*Ps. 15, 6*): *remoto namque cardinali paxillo de loco fidelium, vas craterarum pendens in ipso* (*Isai. 22, 24-5*) factum est *Italico more in contumeliam* quod prius fuerat *in honore* (*Rom. 9, 21+*). *Iam sedit Petrus foris in atrio* (*Mt. 26, 69*), *mittens gladium in vaginam* (*Ioh. 18, 11*), *ad prunas aliorum cum se calefaceret parum* (*Ioh. 18, 18*); quod Galileus «transmigrans»³ fieret, vigeabant filii prophetarum. [[Sed divertere non valebat, qui vincitus nostre provincie cathenis iacebat, et tamen ut «Sathan ipsum» *cribraret sicut triticum expetebat* (*Luc. 22, 31*).]] *Esurientis quoque et sitientis defecit anima* (*Ps. 106, 5*), et nemo illi dabat, nec quisquam *vas per ter submittebat*, *Macta*, inquit, *et manduca* (*Act. 10, 11. 13. 16*). *Huc accessit penetrabilior omni gladio ancipiti* (*Hebr. 4, 12*) erga me violenta suspicio, que dira fuit Petro⁴ crucifixio: *cur in mediis fluctibus mergi incipientem extensa manu non apprehenderem* (*Mt. 14, 30-1*), *aut dormitantis pre tedio* (*Ps. 118, 28*) *latus non percuterem* (*Act. 12, 7*), ac ut *post me veniret relictis retibus non mandarem* (*Mt. 4, 19-20*)? Sed recepta nuper de hiis purgatione canonica, in nos ipsum hanc forsitan sententiam protulistis; *Modice fidei quare dubitasti* (*Mt. 14, 31*)⁹ et *Si omnes in eo scandalizati fuerint sed non ego* (*Mc. 14, 29+*); *recordetur necesse est Petrus verbi quod coram cardinali dixeram* (*Mt. 26, 75+*), super quo totius gratie fundavi *ecclesiam* (*Mt. 16, 18*): *Cantet gallus, ploret amare* (*Mt. 26, 75*). Hermannus ab hoc reatu *pedes manus et capud cum innocentibus lavit* (*Ioh. 13, 9, cf. Mt. 27, 24*), et si Petro *caro et sanguis aliud revelavit* (*Mt. 16, 17*). *Iam iam succingat Petrus tunicas* (*Ioh. 21, 7*), partes petat Teuthonicas, non detineat ultro aperiendum ostium Lumbardorum, quem transmisit *prima et «secunda» custodia Romanorum* (*Act. 12, 10*).

Bonum est ibi nos esse: fiant tabernacula (*Mt. 17, 4+*),
ubi cum mori sit necesse, vivamus per secula.

Amen.

§17. *Magister Romanus, de xvi impedimentis in astronomia.*

Manuscripts: Basel, Univ. Bibl., F II 15, 97r-107v, 15th c.; Erfurt, Wiss.Allg.Bibl., 4^o 368, 63r-70v, 14th c.; München, Bayer.Staatsbibl., Clm 25005, 50v-68r, 15th c. (all in Zinner 1925, no.9035-7, and in T&K 1410, where London, Brit.Lib., add.23770, 41va is cited as an apparent extract). Cited by Jørgensen 1910,255; 1914,345 n.2; 1933,194 n.4; Bjørnbo 1912,94 n.4; Zinner 1936,320; O.Pedersen 1963,5;1968,5;1974,540;1976,7-8, as evidence for Peter Philomena's connection with Roskilde (§7). Thorndike (*Magic III*, 1934, p.647-9) prints the incipit and gives a summary of the rest of the treatise.

I have seen the Erfurt and München manuscripts (E and M in the following), the texts of which do not seem to yield any explicit clues to the dating. Thorndike (*op.cit.p.648*), after having discussed the possible identifications and datings of Peter with inclusion also of Peter the Dominican (§10a), arrives at a composition date about 1300. The only relevant part of the treatise seems to be the incipit, which is here printed from E; variants from M are given in parentheses. Orthography and punctuation are mine.

Iste (est *ins.M*) liber quem ad instantiam mei magistri Petri Philomena(!) canonici Roskendensis (Rolk-EM) composuit magister Romanus, civis Romanus et urbis medicus, in magisteriis iudiciorum astrorum expertus. Scito quod omne quod stellae significant, scilicet an res fiant et perficiantur, vel quid prohibet ut res (u.r.: quod M) non fiant nec perficiantur (-iuntur M), et quae sint causae destruentes postquam sint perfectae, hoc (*om.M*) fit 16 modis, qui dicuntur: Profectus, deterioratio, . . . (rest astrological).

§18. *Liber daticus Roskildensis.*

The obituary/anniversary of the Chapter of Roskilde was in use since 1274 (dating from §18b below, cf. Otto 1933,28-9) and until the Reformation, ca. A.D.1536. The book was destroyed in the fire of Copenhagen in 1728. The two astronomical fragments known from it (§18a-b below) are extracts made by Thomas Bartholin about 1680 (Otto p.23). Fragment (18a) was first printed by Otto 1933,32; I know of no discussion of it except some brief unpublished notes by O.Pedersen. Fragment (18b) was printed by Langebek (*III,1774,267-8*) and again by Otto p.32-3. It was tentatively connected with Peter Philomena by Bjørnbo (1911/2 p.116; 1912,93-6), Zinner (1931,358;

1936,327), and Otto (1933,29 n.25), whereas Jørgensen (1933,195 n.1, on Zinner 1931), Jørgensen/Heegaard (1940,292) and O.Pedersen (1963,6;1968,6-7;1974,541;1976,9; in Lindberg 1978,322) take no stand in the matter. For the suggestion, by Zinner and O.Pedersen, that Peter took the idea with him to Paris to be used by William of St.Cloud, see §9.

The texts are printed from Otto 1933, keeping Bartholin's orthography; one or two corrections have been introduced from a re-check of the manuscripts.

(18a) København, Kgl.Bibl., e don.var.1,2^o, Tom.Barth.11, p.395. Earlier at København, Univ.Bibl. Excerpt from the beginning of the *Liber Daticus*: geographical position of Roskilde.

In the summary below, the figures from the source are in italics; those supplied or calculated by me, in Roman type, include the coordinates of Rome and Jerusalem current in the Toledan Tables (Toomer 1968,134-5). The value for the latitude of Roskilde thus obtained also occurs in a 14/15th-century note in a manuscript formerly in Roskilde, now Stockholm Kgl.Bibl., X 767, p.131 (Jørgensen 1910,257 with misprints; Beckman/Kålund 1914,XLI; cf. *Algorism, Pref.* §1). Assuming, with ms.F of the *Eclipsorium*, that Roskilde lies 25^m, or 6°;15, to the East of Paris, one arrives at the longitude of 23°;45 E for Paris. This value also occurs in the *Quadrans* 2, §16 (see Part 2 of this volume), and in the Toledan Tables bearing the label "sedes regis Francorum". The distances in miles may have been calculated by mechanically using the equation 1°=66 2/3 miles (as against e.g. the value of 56 2/3 from Alfarгани ch.9 and elsewhere). In other words, the distances in longitude are reckoned on the equator. This pretty well explains the mileages in longitude and latitude; the direct distances, as re-calculated with modern values of the trigonometric functions, fit badly, but there seems to be no easy way to correct the text.

	Latitude	Longitude	Direct
<i>Distances:</i>			
<i>Roskilde-Rome</i>	(lost)	5°;25' W (ca. 0 ^h ;22') ~358 mil.(361.1)	13°;50' 933 mil.(922.2)
<i>Roskilde-Jerusalem</i>	23°;12,16' N ~1544 mil.(1547.0)	26° W (1 ^h ;44') ~ca. 1733 mil. 3 st. (1733.3)	29°;31.6' 1800 mil.(1968.4)
<i>Positions:</i>			
Rome	41°;50' N	35°;25' E	
Jerusalem	32° N	56° E	
Roskilde	55°;12,16' N	30° E.	

(Hdg.): Liber Daticus Roskildensis in prooemio. (Txt): tudinis autem differentia est quinque graduum et viginti quinque minutorum. Quod spacium terre est, tricentorum quinquaginta octo miliariorum. Spacium vero temporis fere viginti duum minutorum hore unius, id est trientis et fere tricesime hore unius. Tanto enim Roskildis est occidentalior Roma. Directa igitur distantia inter has civitates est, Nongenta triginta tria miliaria. Differentia latitudinis inter Roskildis et Iherusalem viginti trium graduum, duodecim minutorum, et sedecim secundorum. Quod spacium terre est mille quingentorum quadraginta quatuor miliariorum: tanto enim est Roskildis septentrionalior. Longitudinis vero differentia est viginti sex graduum. Quod spacium terre est, mille septingentorum triginta trium miliariorum et fere trium stadiorum. Spacium vero temporis hora una et quadraginta quatuor minuta unius, hoc est bisse et quintedecime unius: tanto enim est Roskildis occidentalior Iherusalem. Directa igitur distantia inter has civitates est mille octingentorum miliariorum.

(18b) København, Kgl.Bibl., e don.var.1,2°, Barth.F V, p.117-8. Earlier at København, Univ.Bibl. Excerpt from the beginning of the *Liber Daticus*, mentioning a calendar, now lost, with auxiliary day-by-day tables of solar longitude and meridian altitude, and describing a table of day-length (6^h;56-17^h;4) for Roskilde, made in the year 1274 after the Incarnation. This is said to be symmetrical about the solstices June 15 and Dec.15, and may have been separate from the Calendar. The values of all the tables are said to fall one day earlier after 288 years (this number in Sacrobosco's *Computus*, and common elsewhere).

This fragment poses a long-standing problem of what kind of observations can have been made in Roskilde, and of how to interpret the "astrolabium et gardagas sinuum" said to have been used for making the day-length table. Since the discussion has mostly been conducted without knowledge of the fragment §18a, the answers have

been indeterminate. Bjørnbo (1912,94) pointed out the relevance of the *canones Azarchelis* (on the Toledan Tables), which tell how to use observed meridian altitudes of the sun for calculating both geographical latitude and day-length, and also contain the *kardaga*-table (listing the sine-values 39,75,106,130,145,150(=unity) for the arguments $15^\circ, \dots, 90^\circ$). Zinner and O.Pedersen (§18 above) assume that at least some solar altitudes were observed, and used directly for calculating day-lengths. In fact, if fragment §18a is taken to show that a value for the geographical latitude was current, and if the Toledan Tables were utilized, it suffices to assume just one observation of a solar altitude. For instance, if an observed altitude of round 57° were corrected with a declination value from the Toledan Tables, e.g. $+22^\circ;12,16$ for a time when the solar longitude is 71° or 109° , this would yield the geographical latitude implied by §18a, with its over-precision inexplicable on the basis of pure observation. At the next stage, all day-lengths may be calculated by means of declination values taken from the tables; this assumption, however, does not too well fit the preserved maximal day-length value. Indeed, for computing the day-length h at the geographical latitude b from the solar declination d , the *canones Azarchelis* prescribe a procedure equivalent to $15 h = 180 + 2(180/\pi) \text{ arc sin} (\text{tg } d \text{ tg } b)$; and with $d = +23^\circ;33,30$ (at solstice), $b = 55^\circ;12,16$, and modern values for the trigonometric functions, this would yield $h = 17^h;11$ against the $17^h;4$ of our source. One would rather suppose that the *kardaga*-table was used with some rounded values of the parameters, or that the "astrolabium" was for this purpose used as a computing device; but this appears to defy verification.

(Hdg.): In proemio huius libri ubi uariæ tabulæ Astronomicæ et Chronologicæ: (Txt): Cum igitur secundum maiorem remotionem ab æquinociali circulo maior dierum artificialium causetur inæqualitas, et tanta sit remotio huius civitatis ab æquatore, quanta nunc demonstrata est. Prolioxior itaque dies Roskildis est decem et septem horarum et quatuor minutorum hore unius. Brevissima vero dies in ea est sex horarum et quinquaginta sex minutorum, sicut in tabula diversitatis dierum artificialium ad eandem civitatem subscripta reperitur. In qua dies et menses eque distantes a solstitialibus diebus, id est a quinto decimo die Junii vel Decembris coniunguntur, quoniam oppositorum dierum et eque distantium a solsticiis accedendo vel recedendo equalis est longitudo. Invento itaque numero diei cuiuslibet mensis, in eadem linea dextrorsum inuenies quantitatem eius Roskildis, et in aliis locis omnibus eandem habentibus latitudinem. Quanta igitur est hec dies, tanta erit nox diei ab altero solstitio utrobique eque distantis. Ut igitur elevatio solis, et locus eius

in celo, necnon et quantitas horarum diei cuiuslibet et noctis Roskildis et in tabula et in martyrologio inferius annotata, infallibiliter sicut et nunc in perpetuum habeantur, quibuslibet ducentis octoginta octo annis transactis a constitutione huius tabulæ, anticipanda sunt omnia predicta per unum diem. Perfecta est autem hec tabula per Astrolabium et Gardagas sinuum Roskildis anno dominice incarnationis millesimo ducentesimo septuagesimo quarto.

§19. *Letters of Boniface VIII and Benedict XI.*

(19a) Archivio segreto Vaticano, Reg.Vat.50, 335v, ep.131. Printed in G.Digard & all., *Les Registres de Boniface VIII*, vol.III, 1921, c.775 no.5249; A.Krarp, *Bullarium Danicum*, 1932, p.834-5 no.947; *Diplomatarium Danicum 2.Rk.5* (Fr.Blatt & C.A.Christensen), 1943, p.247-8 no.261. Used as evidence for Peter Philomena's connexion with Roskilde, and his position in the Church, by Jørgensen 1933,194 (from Krarp), Lehmann 1936,53 (from Digard), Jørgensen/Heegaard 1940,291; Sällström 1957,196-7; O.Pedersen 1963,5;1968,5;1974,540; 1976,8-9.

Letter of July 4,1303, from Boniface VIII to the bishop (Kristian; name blank) of Ribe, the prior (Peter) at the church of Skt.Knud, Odense, and Peter Philomena, canon of Roskilde, enjoining upon them to take care that the *praepositus* of the church of Gamtofte (Funen) may enjoy his emoluments while studying at Rome. I print the letter in its entirety, though the subject is probably irrelevant for the biography of Peter Philomena. The text of the *Diplomatarium Danicum* has been followed, with a couple of restitutions of the wording based on an inspection of the manuscript.

(Hdg.): Uenerabili fratri ·· episcopo Ripensi, et dilectis filiis ·· priori sancti Kanuti Othoniensis, ac Petro Philomene canonico Roskildensi. Prouiso ne in fraudem constitutionum ipsarum aliquid attemptetur, et quod dictus prepositus interim, eidem ecclesie, in prepositure officio, per ydoneum uicarium faciat deseruiri, contra(dictores) per cen(suram) et c. usque compescendo. – Datum Anagnie iiii nonas iulii anno nono.

(19b) Archivio segreto Vaticano, Reg.Vat.51, 10v, ep.32. Printed in Ch.Grandjean, *Le Registre de Benoît XI*, 1905, c.41 no.32; A.Krarup, *ed.cit.* p.841 no.956 (incipit and explicit); *Diplomatarium Danicum*, *vol.cit.* p.260 no.276. Cf. Sällström 1957, 196 with n.15.

Letter of Nov.22,1303, from Benedict XI. Same subject as above, but the two last addressees are now the Dean of Würzburg and Petrus de sancto Benedicto, cantor at Bourges. Text constituted as above.

(Hdg.): Uenerabili fratri .. episcopo Ripensi, et dilectis filiis .. decano Herbicensis, ac magistro Petro de sancto Benedicto cantori Bituricensis ecclesiarum. (Txt, as §19a above, except for insignificant variants:) Dilectus filius Henricus. . .faciat deseruiri. Contra(dictores) per cen(suram. . .). – Datum Laterani x kalendas decembris anno primo.

§20. *Note ascribing Quadrant to Petrus de Dacia.*

Paris, Bibl.Nat., lat.7195, 91vb. Vellum, 29 × 20, ff.146, 14th c. Reference and readings from Poulle 1964, 208 n.62. The manuscript belonged to the monastery of St.Lazarius at Blois, which lent it out once in 1419 (note at 146v; Delisle II, 1874, 341). In 1522 it was borrowed by Orontius Finaeus from the clock-smith Iulianus Coul-dranus (?=the ".Couldroy" at Blois in 1533, Delisle I, 1868, 177-8), who had it from the monastery (second note at 146v, hand *p.20* uncertain). The present note is dated to the end of the 14th century by Poulle; I suppose it might be as late as the 15th/16th century, possibly coeval with Orontius Finaeus himself (cf. *Mss. Datés* II, Plate CLXXX, and *Calendar*, *Pref.* §2b, ms.Pe). It stands at the end of a *Saphea Azarchelis* (T&K 403), and the manuscript continues with Grosseteste's *Computus*; a few corrections to both these texts are in a similar hand, but our note seems unconnected with either of them.

Petrus de Dacia	1302	conuerterunt astrolabium
Profatius Iudeus	1331	in quadrantem.

§21. *Comparison of the times of some mean conjunctions in the Calendar, the Eclipsorium, and various other tables.*

The manuscript tables were utilized according to their canons, without intermediate calculation of their parameters: the latter is a feature of a forthcoming treatise by R.P.Mercier, which should eventually be checked for the results here tentatively given. The calculated values can be found in the conspectus at the end of this paragraph. The readings used are those of a majority of manuscripts; some readings have been emended by interpolation in the tables. For reasons of space, detailed textual notes could not be given. The duration of a mean lunation is 29^d12^h;44,3,20 everywhere except in the Alfonsine Tables.

Calendar of Peter Philomena. Begins at midnight before 1293 Jan.1. Shows the current day, current hour (h: numbered 1-24 from midnight), and current quarter of an hour (q: numbered 1-4) of the conjunction. If the quarter-value is not indicated (noted as q "-"), a time within the last minute of the hour is meant. For details of the notation see *Calendar, Pref. §3.*

The conjunctions have been numbered chronologically (cf. Lindhagen 1916,7-8, for Grosseteste's calendar), and re-calculated using the time 1293 Jan.9 current, 2^h;52,50 after midnight, for conjunction no.1. The list below gives the times most closely approaching to a boundary between two quarter-hours or around the last minute of an hour.

No.	Re-calculated as		Shown by Calendar, at same dates	
	date	hour	h	q
851	1361 Sep 30,	3; 0, 3,20	4	1
327	1319 May 20,	2;14,56,40	3	1
184	1307 Oct 27,	5;15	6	1
41	1296 Apr 4,	8;15, 3,20	9	2
597	1341 Mar 18,	8;29,56,40	9	2
454	1329 Aug 25,	11;30	12	3
311	1318 Feb 1,	14;30, 3,20	15	3
867	1363 Jan 15,	14;44,56,40	15	3
724	1351 Jun 24,	17;45	18	4
581	1339 Dec 1,	20;45, 3,20	21	4
471	1331 Jan 9,	11;58,56,40	12	4
328	1319 Jun 18,	14;59	15	-
185	1307 Nov 25,	17;59, 3,20	18	-
57	1297 Jul 20,	19;59,56,40	20	-

There seems to be some vacillation in rounding at the very boundaries (cf. no.184 compared to 328, 454, and 724), but apparently there are no disturbing errors elsewhere: for some variants cf. *Calendar, Pref.* §4. Especially, no.328=§4a, **169,2**; no.581=§4d,**335,3**; no.724=§4c,**175,4**; no.867=§4e, **15,4**. Thus the times re-calculated are probably the exact ones used, or at least within some 3 seconds of them.

Eclipsorium. Tables: §41,§43-4 of the treatise as printed in this edition, with canon §32-39.

Toledan Tables of conjunctions (Toomer 1968,no.52-55). Sources: Princeton, U.L., Garrett 99, 69v-71r (G); Paris, Ste.Geneviève, 1043, 162r-163v (P); Paris, Bibl.Nat., lat.16658, 132r-133v (B; second half of 13th c.); Erfurt, W.A.B., 4^o369, 195r-v. Ms. B has a set of times for Paris, partly erased, which appear to be 58^m greater than the Toledan times, or corresponding to a difference of 14^o:30 in geographical longitude. I have not seen this value elsewhere.

Toledan Tables of mean motions of sun and moon (Toomer 1968, no.28-9). Sources, with symbols as above: G, 36v-39r; P, 129r-132r; B, 115r-116v. Ms. B has a set of values for Paris, partly erased, in which the sun's longitude has been decreased by 1^o:24 and the moon's by 18^o:41. This would increase the conjunction time by 34^m:2 corresponding to a difference of about 8^o:30 in geographical longitude. A note in B mentions the latter value, and a secondary note corrects it to 12^o:18.

Toulouse Tables of conjunctions. Source: B (above), 79v-81v. The calculated conjunction times before 1297 appear to fall one day beside those found from elsewhere; I have, however, adopted the hour-values in the conspectus.

Toulouse Tables of mean motions of sun and moon. Sources, with symbols as for the Toledan conjunction tables: B, 70r-71v; G, 83v-85r; and Firenze, B.N., II.iii.24, 228r-229r (F). The values of B were followed except for a few places where the photo of B is deficient. The values in FG for the motion of the moon are such as to make all results 1' less (and thus all conjunction times 1^m:58 greater) than those obtained from B.

William of St. Cloud, Almanach. Covers the period from March 1292-Feb.1311 ("1310" in William, since the year is taken to start in March). Sources: Paris, B.N., lat.16210 (lacks 1292); Vat.lat.4572 (lacks 1305-8 and "1310"). Time of conjunction and opposition given for each month, as days elapsed+time in hours and minutes. From the canons it appears that the values would be 40^m less than those obtained from the Toulouse Tables (corresponding to about +22' in the mean motion of the moon, cf. the canon in Paris B.N., n.a.l. 1242,42ra). The conspectus shows the values as given.

William of St. Cloud, Kalendarium reginae. Covers the period Jan.1292-Dec.1310. Sources: edition by Harper (1966), supplemented by Erlangen U.B. 434, 2ra-7v and (second foliation) 1ra-7rb. Said to be made "per tabulas astronomiae, per quas inveniuntur eclipses solares et lunares, quae multotiens sunt expertae et inveniuntur cum veritate motuum concordare", thus apparently a set of mean conjunction tables (Harper p.112). Records each conjunction at the day

following, by means of the hour within which it falls; the hours are noted in the sequence "·11 - ·0", "1· - 12" equivalent to hours no.1-12,13-24 after midnight (my conversion).

If conjunction No.1 is set at 1292, Jan.20, 18^h;25,25 after midnight, then the conjunction times most closely approaching to an hour-boundary are

No.	Re-calculated as current day, hours after midnight	Registered as
202	1308 Apr.21, 10; 0,35, 0	Apr.22, hour no.11 ("·1")
123	1301 Dec.1, 12; 0,11,40	Dec.2, hour no.13 ("1·")
44	1295 Jul.13, 13;59,48,20	Jul.14, hour no.14 ("2·")
187	1307 Feb.3, 10;59,45, 0	Feb.4, hour no.11

Thus the times re-calculated are precise within some 12 seconds.

Novara tables of conjunctions. Accompanied by a canon ascribed to Campanus. Sources: Erfurt W.A.B., 4^o369, 213v-215v, aided by Vat.lat.3118, 53v-55v.

The *Novara tables of mean motions*, in the two manuscripts mentioned, give the same times and longitudes within a few seconds.

The canon (version of Vat.lat.3118,54rb) says that the conjunction time at Paris can be obtained by subtracting 25^m from the time for Novara.

Alfonsine Tables of mean motions. Source: Oxford, Bodl.L., Bodl.491, 41r ff. Only three selected values have been calculated. The mean motion parameters do not appear to be comparable to the rest of those considered. The *tables of mean conjunctions for Paris*, in Par.lat.7286C,48r+ (cf. *Calendar, Pref.* §2b, ms.Pc), occurring together with Jo. de Lineriis' canons from 1322, yield the same longitude values as the Alfonsine Tables, whereas the times are exactly 48^m greater: this difference corresponds to the most commonly accepted value of 12° for the difference in longitude between Paris and Toledo (cf. J.K.Wright, in *Isis* 13(1923)93).

<i>Times:</i>		Toledan	Toledan	Calendar	Eclips.	Alman. Cal.	Toul.	Toul.	Novara	Alfons.

Conspectus of times of seven conjunctions, numbered as for the Calendar of Peter Philomena. All times have been counted so that 24^h of a day equals noon of that day. For the calendars I show the times as re-calculated from the parameters found above. For the tables of mean motions I have given second-values irrespective of the precision of the tabular values, interpolating if necessary; some false precision may have ensued from this. I have not checked whether the equation of time is supposed to be applied with the same sign everywhere.

The time values of the *Eclipsorium* and William's *Almanach* appear analogous and can be obtained from the Novara values by subtracting 65^m, *i.e.* the longitude correction of 25^m plus William's correction of 40^m. The *Calendar* of Peter Philomena can profitably be compared to the *Toledan* mean motion tables only. Neither set of *Toulouse* values would yield the values of William's *Almanach* by the use of his correction, even if the *Toulouse* mean motion values were raised by about 2^m as remarked *ad loc.* This may be due to errors in my sources. I cannot explain the time values of William's calendar, nor the longitude values of the *Eclipsorium*; the rest of the longitude values seem to be all analogous.

EDITORIAL CONVENTIONS.

The individual prefaces should be consulted for exceptions and special features. In collating, short dittographies where the versions did not vary notably have been ignored; running corrections by the text-hand have been tacitly accepted; and missing initials have been supplied. Parentheses may be everywhere used for enclosing comments or supplements by the editor.

Descriptions of manuscripts.

Since most of my photos and microfilms only cover the texts in question, I have generally ignored the wider context in the manuscripts including any index entries. Measurements, where obtainable, are given as height \times width, to the nearest half-centimetre. They have mostly been taken from the catalogues; those measured from originals or microfilms express the page dimensions.

References include only catalogue entries, citations in standard works, reproductions, and treatments which may claim priority in matters of identification.

In the *textual excerpts* I have tried to include any statements concerning authorship and dating. Within each text the citations are separated by dots. "(Txt:)" signals the main hand(s) of the manuscript. "(Hdg:)" and "(Subscr:)" denote headings and subscriptions which are in some way distinguished from the main text, e.g. by rubrication, whether in the same hand as the main text or not. Occasionally, prefixed colons are used for making clear that descriptions continue: thus, "(:Hdg:)" signals a heading to a text already cited. Comments and identifications by me are in parentheses, as well as information on texts or tables not otherwise excerpted.

In the descriptions of *tables*, "(Hdg:)" means the title, wherever it is placed. A *list* is a table the extent of which is arbitrary.

One-dimensional tables are characterized by the number of columns (or rows), two-dimensional tables by the figures for (number of rows \times number of columns) in the body of the table. Extra rows or columns coupled to a table, whether used for entering it or for

reading results, are called "entr(ances)". Instead of some of the numbers mentioned above, the first and last reading of an entrance column (or row, respectively) may be given. Mostly, however, lesser tables coupled to a main table have been ignored in the descriptions.

Rotae may be taken as tables bent into circular discs, such that the sectors and zones of a rota correspond to the rows and columns of some table. The descriptions only mention the number of sectors. If several numbers are given for one rota, it is composed of concentric *rotae* with varying numbers of sectors. *Rotae* with 28, 19, and 15 sectors are as a rule computistical, and concern the solar, lunar, and indictional cycles.

In the descriptions of *calendars*, the term "cycle" is here used for a column with entries showing times of conjunctions or oppositions during 19 years, placed against their proper dates. In an entry such as "10 9^h;8", the number "10" identifies the year for which the entry is valid, and is called the "cycle number". A letter may be used instead, as in the calendars of Grosseteste and Peter of Dacia.

Text, and textual excerpts in descriptions and apparatus.

According to the convention of this series, a near-Classical orthography is used for words not specifically mediaeval. Abbreviations have been expanded tacitly except where some textual problem was recognized. Paragraphing, punctuation, and use of upper-case letters, are on the editor's discretion, as is the notation of numbers: they are generally written in figures if denoting magnitudes, in letters if not, but consistency has not been aimed at. In fractional numbers, decimals are signalled by periods, and sexagesimals by semicolons or commas: thus, 1.5 = 1;30, and 1.51 = 1;30.6 = 1;30,36. Other symbols:

- (manuscript symbols:) : manuscripts which contain the passage following, if fewer than those listed in the preamble to the text.
 () : comments etc.; occasionally, enclosing numbers which are in fact spelt out or written in Roman figures.
 <> : insertion by editor against all witnesses considered
 <*> : insertion believed to be necessary
 [] : passage occurring only in some witnesses, as specified in apparatus
 [] : passage, in some or all witnesses, deleted by editor
 †† : passage which needs emendation.

Apparatus.

In addition to the entries included on the basis of the principles laid down for each text, extra entries are given where the reading adopted appears to need corroboration.

For those texts where some of the manuscripts used are incomplete, the *headings* of pages list the witnesses adduced for the current passage. Witnesses listed in parentheses are used only in the entries which mention them expressly.

The *entries* in the apparatus are generally negative. Thus, if the manuscripts WXY(Z) are listed as currently used, then the entry "et: *def.*Y" means that WX read "et" whereas Y omits some longer passage containing it. Positive entries have the form "et: WX; *def.*Y", equivalent to the above, or e.g. "et: Z; ut Y" or "et: Z; ut Y; *varie cett.*", both informing only about ZY. Entries within entries are in "()", modifying the word or, if expressly stated, the words immediately preceding. Thus the entry "et (*om.*X) sic (s.e. W; sit X): hoc Z" should be expanded to "et sic: Y; sic et W; sit X; hoc Z". Abbreviated variant readings always echo their counterparts in the lemma: thus, in the example "et sic: Y; sit X; s. et W", manuscript W reads "sic et", not "sit et".

Examples illustrating common symbols in the apparatus:

a(>X)	: all manuscripts in Class a, except ms.X
inv.; inv-do	: cites a preceding word like "inveniendo"
ab ₂	: cites the second occurrence of "ab" in the line currently referred to
ab--hoc	: cites the phrase from "ab" up to and including the "hoc" occurring next
ab. . .hoc=ab,hoc	: cites "ab" and "hoc" irrespective of words intervening
Xa.c.; Xp.c.	: manuscript X before and after secondary correction(s)
ab <i>add.</i> X	: extra text in X
<i>om.</i> X	: text missing in X
ab <i>ins.</i> X	: extra text, secondarily inserted in X
<i>del.</i> X	: text cancelled in X (by strokes, dots, or otherwise)
<i>gem.</i> X	: text repeated in X
<i>inv.</i> X	: two words interchanged by X
<i>def.</i> X	: text plus some context missing in X
<i>alia</i> X	: different phrasing in X, not cited nor compared
<i>n.l.</i> X	: X illegible, mostly because of damage
vel <i>vel</i> et X	: the reading of X may be either "vel" or "et"
<i>mg.</i>	: written in margin
<i>s.l.</i>	: written above the line
<i>ras.</i>	: erasure
<i>vacat</i>	: empty space
<ab>	: "ab" left out or, if stated, illegible or lost mechanically
«ab»	: "ab" inserted secondarily
[[ab]]	: "ab" cancelled
a(ut)	: abbreviation expanded by editor (noted only occasionally)
ab <i>ante</i> hoc	: "ab" placed before the nearest preceding occurrence of "hoc"
ab <i>post</i> hoc	: "ab" placed after the nearest following occurrence of "hoc".

Expositio
super Algorismum

§1. The authorship of this text was first noted by Eneström (1885,3)20-1. Printed by Max.Curtze (Copenhagen 1897, with the collaboration of M.Cl.Gertz), from ms.S(below), aided by ms.C (Curtze p.VI-X). The present edition rests on mss.CEVS, cf. §2d. See also *Introduction* §3a.

Two further manuscripts which have been cited in this connexion are: Leipzig, Univ.Bibl., 1470, 433r-444v (Curtze 1897,IV; OP 1.4), and Salzburg, Bibl. der Erzabtei St.Peter, b IX 14, 74r-82v (=93r-101v, older foliation. Curtze, *ibid.*; OP 1.10). They contain the

Algorism of Sacrobosco with glosses, part of which may be paraphrased from our text. I have not discovered any ascriptions to Peter of Dacia. Some similar cases are mentioned in the Preface to the *Algorism*, §4.

Since the present text occurs in manuscripts of mixed, mainly astronomical, content, no stable context can be expected. Considering only the works immediately preceding and following our treatise, it is twice found to be appended to the *Algorism* (in A and S). In four rather more important manuscripts (HBED), all of them probably English, it is followed by Robertus Anglicus' commentary on Sacrobosco's *Sphere*, "Una scientia nobilior" (ed. Thorndike 1949, 143 ff.). No other works have been found more than once in close proximity to Peter's.

§2. *The manuscript tradition.*

The tradition appears to be thoroughly contaminated, and only some general features are noted here. The manuscripts D and W have been ignored wherever they are not expressly cited.

§2a. Manuscript E, together with either C or D, contains a few passages which are necessary for the sense and may be original. They are:

- | | |
|--------|--|
| 49-51 | et secundo--numerum: ED; <i>om.cett.</i> |
| 158-60 | idem supponunt--dicit quod: EC; <i>om.cett.</i> (remains in D) |
| 997-9 | et in omnes--habentes ED + et facit--multiplicandi ETD: <i>om. VS; def.cett.</i> |
| 1399 | linearis--cum dicit: EC; <i>om.cett.</i> |
| 1816-7 | unde quia--constat: ED; <i>om.cett.</i> |

This may serve to set each of E,C,D apart from the rest of the tradition. But at least E is also connected to STA, cf. §2b; further, E,C,D, and possibly T, do seem weakly connected, as is shown by the following:

- | | |
|------|--|
| 221 | (numbers, in various notations) 11-20-21-30: 11-12-12-13(same) ECD |
| 525 | proba: probatio (probo T) ECDT |
| 1260 | operandum: E; operandum scilicet anteriorandum D; anteriorandum <i>cett.</i> |

Finally, E alone contains two passages which seem to be secondary, namely, 72-77, obviously a gloss, and 1672-3, which might be an attempt to remedy an obscure passage.

§2b. ESTA, with sub-groups STA and ST, are characterized by numerous and generally short glosses in the text, and by other kinds of explications which are sometimes either superfluous or wrong. Since these additions vary to some extent in location and wording, they may have originated in a copy with interlinear glosses. Glosses from (E)STA:

- 26 sic: sequitur conclusio *add.STA*
 420 debet poni: scilicet ipso *add.EST + quaternario deleto add.ESTA*
 499-502 addita--figuris: ESTA; *om.cett.*
 547 haec est divisio (definitio A): ESTA; *om.cett.*
 1167 99: tunc 9 de 6 dividere non potest *add.ESTA*(slight variations);
 et ma(i)or de mi(no)ri sumi non potest *ins.H* (emendation?)

Other explications, some of them plausible:

- 278 competenter potest poni: ESTA (with Sacrobosco); ponatur D,
cett.
 437-8 addi debet ad figuram: et si est--ad illam STA (redundant)
 492-3 addas primam ad primam: VCHBM; addas tunc--suprapositam
 ESTA
 1204-5 et alias--superioribus: ut aliae--subtrahi (*supra*) SA; *def.T*

Errors:

- 184-5 et quid--limites: *om.SA*; 9--1 E (inserting the text in lower
 margin)
 289 novies: nongentesies ESTA; novies vel nongentesies W
 292 novies: nongentesies EST; *om.W*; *def.C,A*
 1337 123456: iste numerus scilicet 123456 S, *similia T,A*
 1110 sit etiam 3: sicut est 3 S,T *ferē*; sicut est 3 A (with a longish
 improvised insertion due to loss of context)

Compare also the (?re-)statements of the chapter incipits at 786-7, 859-60, and 1123-4.

The introductory phrases "deinde cum dicit (lemma)" or "tunc sequitur illa pars (lemma) in qua" generally occur in STA only, with the exceptions

- 250 (*lemma*): deinde cum dicit (*lemma*) HBST; (*lemma*) hic CEA
 467 et tunc cum dicit: e.t.d. T; e.t. C; *om.A*
 813 (*lemma*): tunc sequitur alia (*om.TA*) pars ibi (*om.TA*) (*lemma*) in
 qua ESTA
 904 (*lemma*): et cum dicit (*lemma*) EST; *def.C*
 1634 et (*om.V*) tunc cum dicit: deinde ibi A
 1638 et tunc cum dicit: deinde c.d. ST; *om.A*

Curtze's edition reports these phrases as concerns S(T): there they are applied with few exceptions in about the first three quarters of the

treatise, after which they almost disappear. In A they are often abbreviated or left out. A different set, mainly of the form "sequitur textus (lemma)", is found in W, generally introducing larger-written section-headings.

Except for STA, it is hard to isolate sub-groups within ESTA. ET have some extra glosses against SA and the rest, such as

- 538 praecedenti: specie scilicet (de) additione *add.ET*
 654 dictum est: scilicet ad dextram *add.ET*,

one apparent conflation:

- 743 faciendum: VHBD; operandum CSA; operandum...sive faciendum ET,

and at least one error,

- 811 a laeva: aliena ET; *def.A*

On the other hand, A sometimes, and SA at least once, leave out phrases which may have been glosses. The case in SA is

- 612 id est mutuo accipiat: *om.SA*

The pattern above is in some respects illustrated by the passage 323-5, which is, by and large, given correctly by C as "Sed quanto aliqua figura est *posterior*¹, ²*tanto est sinisterior*³ per secundam suppositionem; (⁴) ergo pronuntiando incipiemus a *sinistris*". The phrase (^{2.3}) occurs in CED; it is missing in TA,VS,HB; and MW show a modification which may be secondary, see below.

T and A try to compensate for the loss in slightly different ways: A fills out (^{2.3}) with "tanto minorem numerum repraesentat", whereas T (in company with E) adds "tanto maiorem numerum significat" at the point (⁴). It may be guessed that these two phrases are variants of one and the same interlinear addition, ignored by VS, which have nothing corresponding. E, on the other hand, has both (^{2.3}) and T's addition at (⁴), which may mean that E has used some text like T as a secondary source.

HB, which lack (^{2.3}) and any substitutes, change (⁵) to "posteriori" and leave it at that. MW, further, show "sinisterior" at (¹) and "posterior" at (³), which may just mean that the change at (⁵) has worked backwards. D has mainly the same text as C, but corresponds with HBMW at (⁵).

§2c. The remaining manuscripts VHBMW (with D) share one addition against C,ESTA, namely,

307 vidi--scribere: VMW; iudaei--docent HB; vidi--iudaeos D; *om.cett.*

One minor common error seems to be

970 in consequenter se habentes: in cons. (c.in BW) sequentes (*del. V*)
VHBW; *def.M*

HBMW form a sub-group as indicated by

138-9 de dicto in scriptum: de s. in d. HBMW; *om.T; def.C*

140 de scripto in dictum: *del. &* de d. in s. *ins.M*; de d. in s. W; *def.C*
(correction caused by 138-9)

192 quia rotunda (docenda HB) est: *post* figura theta *habent* HBMW

This can be further divided into the sub-groups HB;MW. A few examples of MW:

184 novem limites: n.digitos MW

230 pronuntiando: scribendo M; scribendo pronuntiando W

337 et Graeci: V; Lombardi et Graeci MW; *varie cett.*

344-5 scilicet Teut. sive: id est non communicantes linguae Latinae, ut
sunt MW; *def.C; varie cett.*

W, at least, seems to be influenced by STA: cf. the example from 289 under §2b above.

HB share very many errors and additions. A few of them are:

581 eundem: ei H (damaged); enim B; *om.A*

582 factio: fa H (damaged); fac B

680 subtrahere ideo. . .relinquas. 90: subtrahas igitur. . .relinquas 90
HB

1190 supraposita: (poterit)--denotandum *ins.H,add.B*

1230-1 4 sunt 32--126 et: *om.H; def.A; habent B,cett.*

As exemplified, variants in B very often correspond to secondary corrections in H, and on the whole H must be considered as a main source of B. It is, however, not the only one, as seen from the last example. As a whole, HB are chiefly connected to MW, as seen above, but also elsewhere, e.g.

261 loco. . .dextram posita: 1.pos. . .d. HBAD; 1.pos. . .d.pos.MW

399 addendo numerum: additio numeri AH; ex additione numeri
Ap.c.,Hp.c.,B

857 post peractam duplicationem: VCSW; post dupl. factam (f.d. A)
ETA; per dupl. factam est post peractam dupl. HB

§2d. An approximation to a summary of the results above might be as follows:

For the constitution of the text I have chosen C, E, V, and S as the best all-round representatives of the tradition. As for the others, T, D, and M are incomplete in different ways; and A, H, B, and W are comparatively faulty and on occasion innovative. Thus I generally prefer the majority reading among CESV, with a hesitation where C goes against the rest. Where these manuscripts are evenly divided, I generally prefer EV to CS, on account of the generally high quality of E and V; and VC to ES, because of the supposed contamination of E, although in minor matters I have adopted not a few of ESTA's readings as good conjectures. Between CE and VS I have chosen freely. In short, the present text is an eclectic one, resting most heavily on E and V.

§3. *The edition.*

See §2d for the utilization of the manuscripts CEVS and the principles for selecting variants. On notation in general, cf. *Editorial conventions*.

In the text the chapter divisions follow the manuscripts and the sense of the text. Chapter rubrics, which only occur in BS (and occasionally in H as additions), have been disregarded. The division into sub-sections is by the editor. Numbers such as (117) within the text refer to paragraphs in the *Algorism*.

In the apparatus an entry occurs wherever the text rests on two or less of the manuscripts CEVS, except for the types of variants mentioned below.

In the following cases, if the text rests on the majority of CEVS or just on VE, no entry is generally found in the apparatus: variants in word-order which do not affect the sense; iste/ille; ergo/igitur; cum/tamen; quod/quot; notation of numbers when named ("XV est maior denario"); notation of number-symbols when named ("binarium

ponas supra 3"); "etc." in lemmas; "cum dicit"/"(et incipit) secunda (pars)) ibi" as introducing lemmas referred to.

In the following cases no variants are registered in the apparatus: notation of numbers used for counting; of numerical adverbs and ordinal numbers ("duo facit, primo enim. . .; secunda ibi. . ."); and of numbers in calculations ("subtrahantur 5 et remanet 2", where "5" would mean "quinque", and "2", "binarius"); however, for the words "cifra", "unitas", the rule above is followed. The examples of calculation can almost always be re-constructed from the context, and generally no variants are given.

Some selected readings from Curtze's edition have been cited in the apparatus with the marking "Cu". I have tried to include the interesting conjectures against SC, and to exclude obvious errors, but have not striven for consistency in either respect.

§4. *Title and date of work.*

Only the manuscripts HBSDW carry a title connected with the text, and only BSW in the text-hand. A conflation of B and D would yield "Expositio magistri Petri de Dacia super algorismum", but the evidence is slight. The subscription *l.*2043-7 is in VCHBE and thus probably original: it gives July 31st, 1292, as the date of completion of the treatise, with the variant "12901" = 1291 in C. Since C is elsewhere quite faulty in its number notation, 1292 should be taken as safely attested. The "per magistrum Petrum de Dacia dictum Philomenam" of the subscription leaves no doubt about the author.

The place where the work was composed can only be guessed at from a wider context (cf. *Introduction*, §7). It may have been the outcome of a course introductory to astronomical studies, cf. the commonplaces "ipsa astronomia" *l.*37 and "more astronomorum", *l.*719. No contemporary authors are cited.

Omnia quae a primaeva etc. (1): in hoc tractatu determinatur de arte numerandi sive de numero practico, in quo auctor sic procedit: primo enim in praemittendo prooemium aperit intentionem suam respectu dicendorum in hoc tractatu, et secundo (12) de intento
 5 exsequitur, ibi *Est autem numeratio*. – In prooemio (1-11) quattuor causae huius operis tanguntur per ordinem: primo (1) finalis, secundo (2) efficiens, tertio (3) materialis, quarto (10) formalis. Et est iste ordo congruus: finis enim movet efficientem, efficiens disponit materiam ad introductionem formae. Causam finalem tangit, cum
 10 dicit *Omnia quae a primaeva* (1); efficientem, cum dicit *Hanc igitur scientiam* (2); causam materialem, cum dicit *Numerus quidem dupliciter* (3); et causam formalem, cum dicit *Huius autem artis* (10).

Causa finalis (1) huius artis est perfectior cognitio omnium, quia, sicut probat auctor, *ars numerandi est cooperativa in universa rerum*
 15 *cognitione*, quo ostenso satis erit evidens de fine huius artis. – Ad probandum autem istud accipit quandam propositionem a Boethio in *Arismetica* sua. Dicit igitur: *Omnia quae a primaeva rerum origine processerunt formata sunt ratione numerorum*; vult dicere quod omnia processerunt in esse sub aliquo numero, quia unum sub ratione
 20 unitatis, duo sub ratione binarii seu dualitatis, et sic de aliis. Et tunc subdit aliam propositionem acceptam ab Aristotele secundo *Meta-physicae*, dicens quod sicut res sunt, *sic cognosci habent*; ex quibus infert conclusionem, dicens *unde ars numerandi est cooperativa in universa*

Inscriptiones quas praebent HBSD in praefatione quaeras.

5 exsequitur: prosequitur CHBSTA **8** congruus (conveniens V); vel (et T) communis add. ST; alia C **10** primaeva: etc. add. VHBS efficiens: e. causam tangit V; causam e. tangit S; e. tangit M **11** cum dicit: cum (om. C) subdit VC; ibi A dupliciter: duplex (est add. HB) CHB; d. notificatur S; om. T; def. A **13** causa: autem add. VS perfectior (perfectio et V); perfecta HBSA **16** istud: illud CMTAD; id V accipit: -imus ED; -iamus C *Inst. Ar. I,2* **21** cf. *Hamesse, Les Auctoritates Aristotelis 6,159 (ex de an. 3.7, 431a1-2) et ibid. 1,42 (ex Met. α 1, 993b30-31)* **22** dicens: dicente E **23** unde: una C;

rerum cognitione. – Quasi sic argueret: omnia, sicut sunt, sic cognosci
 25 habent; sed omnia sunt sub aliquo numero; ergo omnia cognosci
 habent sub aliquo numero; si sic, ergo ars numerandi valet ad
 cognitionem omnium. Huius rationis primo ponit minorem, et
 secundo maiorem, cum dicit *Et quemadmodum sunt*, et tertio conclu-
 sionem, ibi *unde in universa.* – Propositio prima, sicut dixi, scribitur in
 30 Arismetica Boethii, et sub his verbis: "Omnia quaecumque a pri-
 maeva rerum natura constructa sunt, numerorum videntur esse
 ratione formata"; et subdit ibi Boethius: "Hoc enim fuit principale in
 anima conditoris exemplar. Hinc enim quattuor elementorum mul-
 35 titude mutuata est, hinc temporum vices, hinc motus astrorum
 caelique conversio". Cognitione igitur omnium finis est huius artis
 secundum auctorem, sed ego credo quod finis immediatior eius est
 ipsa astronomia: est enim practica huius artis, sicut instrumentum
 inquirendi quantitates motuum caelestium.

Hanc igitur scientiam (2): tangit causam efficientem huius artis,
 40 et patet. Sed notandum est quod aliud est dicere causam efficientem
 huius artis, et aliud est dicere causam efficientem huius tractatus. Qui
 enim artem hanc numerandi practicam tradidit, erat Algu philosophus
 Arabicus, ex principiis et conclusionibus arismeticae eam
 eliciens; qui autem hunc tractatum edidit, erat Latinus aliquis, et ut
 45 dicitur Iohannes de Sacrobosco, artem hanc diffusius ab Algo tradi-
 tam succincte in numerum brevem capitulorum redigens et compila-
 lans.

Numerus quidem (3): tangit causam materialem huius artis, quae
 est numerus, et facit duo: primo enim describit numerum, [et secundo

ut M; def. V 24 rerum cognitione: c.r. EC; def. V 28 secundo: ponit add.

 ESTA 48 quae: et CHBE 49 primo enim: p. S; nam p. V; om. T 49-
 51 et secundo--numerum: E; secundo dividit ibi numerorum alius primo 2 facit

50 (5) eum dividit, ibi *Numerorum alius*. Auctor circa primum (3) duo
facit: primo enim describit numerum, et secundo (4), quia in
descriptione numeri usus est unitate, ideo notificat quid sit unitas,
cum dicit *Unitas vero est*. – Dat igitur (3) duas descriptiones numeri,
55 *quidem etc.*, et patet. Sed notandum quod, cum dicitur *numerus est*
unitates collectae, sola materia numeri tangitur, sicut si describatur sive
definiatur domus sic: "Domus est cooperimentum ex lapidibus
lateribus et lignis"; sed cum dicitur quod *numerus est multitudo etc.*,
tangitur forma numeri: multitudo enim resultat ex aggregatione
60 unitatum, sed, sicut vult Avicenna in sua *Metaphysica*, in his quae per
aggregationem fiunt, compositio sive aggregatio est forma. – **Unitas**
vero (4): quia describendo numerum usus est unitate, ideo notificat
quid sit unitas, et patet.

Numerorum alius etc. (5): dividit numerum, et duo facit: primo
65 enim praemittit divisionem numeri, et secundo (6) membra divisionis
declarat, cum dicit *Digitus*. Divisio numeri hic data (5) est trimembris,
et patet. – **Digitus etc. (6)**: declarat membra dividenda numeri, et
facit tria: primo enim declarat quis numerus sit digitus; secundo (7),
quis articulus; et tertio (8), quis mixtus sive compositus; et patent
70 partes. – Dicit ergo primo (6) quod *digitus est omnis numerus minor*
denario, id est minor quam X, ut unitas, large accipiendo numerum,
et binarius et ternarius etc. [Et nota quod unitas solum dicitur
numerus accipiendo numerum large, sicut nominativus casus non
dicitur casus, quod ipse cadat ab aliis, sed quod alii casus cadant ab

- 125 specie: primo enim (12) describit numerationem, et secundo (15) assignat numerum figurarum, per quas fit numeratio et universaliter omnis alia species huius artis, et tertio (19) dat regulas in numeratione observandas, et quarto (23) subdit duo notabilia. Et incipit secunda pars, cum dicit *Sciendum igitur* (15); tertia ibi *Notandum igitur*
- 130 (19); quarta ibi *Et sciendum* (23). Circa primum (12) duo facit, quia primo describit numerationem, et secundo (13), quia in descriptione numerationis utebatur "figura", quam in sequentibus confundit cum differentia, loco et limite, ideo convenientiam istorum quattuor et eorum differentiam dat secundo, cum dicit *Figura vero*. – Dicit ergo
- 135 primo (12) quod *numeratio est artificialis repraesentatio cuiuslibet numeri per figuras competentes sibi*. Dicas sic exponendo hanc descriptionem numerationis, quod numeratio est *repraesentatio numeri* dupliciter, scilicet de dicto in scriptum et de scripto in dictum: de dicto in scriptum, cum, sicut pronuntiamus numerum ipsum, ita scribimus;
- 140 de scripto in dictum, cum, sicut scriptus est, pronuntiamus; et ob hoc dicitur quod numeratio est repraesentatio numeri. Et est repraesentatio numeri *artificialis*, ad differentiam usualis, qua antiquitus numeri repraesentabantur: antiqui enim, volentes repraesentare unum vel duo vel tria, unum tractum vel duos vel tres scripserunt, sic: I, II, III.
- 145 Item dicitur quod numeratio est repraesentatio artificialis numeri *per figuras competentes sibi*: non enim omnis numerus per quascumque figuras indifferenter repraesentatur, sed determinatus per determinatas, ut quattuor non per 5 nec quinque per 4, sed quattuor per 4 et

apparebit infra: patebit i. etc. S; i. patebit T; postea patebit MA 127 omnis alia: omnes alias VESA; omnes T 129 igitur₁: ergo HBM; ergo etc. V; quod iuxta 9 limites et *add.* S 129-30 igitur₂--sciendum *om.* C 129 igitur₂ (ergo V); et *add.* VHB; quod quilibet digitus *add.* S; *def.* C 130 et sciendum (*def.* C): sc. igitur T; quod supra *add.* CE; quod supra quamlibet figuram *add.* S 131 descriptione numerationis (*om.* A): describendo numerationem CE 134 secundo cum dicit: secunda (ibi *add.* ST) c.d. quinque per 5. Et per hoc quod auctor dicit quod numeratio est
 150 repraesentatio cuiuslibet numeri, notat sufficientiam artis in hac specie
 traditam, quia se extendit ad omnem numerum.

Figura vero (13): quia in descriptione numerationis posuit "figu-
 ram", et quia inferius confundit haec quattuor nomina, unum
 accipiendo pro altero, scilicet figuram, differentiam, locum et limi-
 155 tem, ideo hic assignat eorum adinvicem convenientiam et adinvicem
 differentiam, et primo convenientiam, secundo (14) differentiam, cum
 dicit *sed a diversis*. – Dicit igitur (13) quod *figura, differentia, locus et limes*
[idem supponunt, id est idem significant, scilicet in hoc tractatu. – Sed
a diversis rationibus (14): dat eorum adinvicem differentiam, et
 160 dicit quod] idem significant, hic tamen *a diversis rationibus imponuntur*,
 quia alia est ratio quare vocatur figura, et alia quare differentia etc.;
 quia, sicut dicit auctor, *figura dicitur quantum ad linearem protractionem*, id
 est quia sic vel sic lineata vel figurata est; et illud idem vocatur
differentia, quia per eam ostenditur, qualiter figura sequens differt a praecedente,
 165 quia aliud significat figura eadem in primo loco et aliud in secundo;
 et illud idem dicitur etiam locus, *ratione spatii in quo scribitur*; vocatur
 etiam limes illud idem, *quia figura in genere sumpta est via ordinata ad*
repraesentationem cuiuslibet numeri. – Nota igitur quod illud, pro quo
 170 universale in numerando, et sic vocatur limes, quod idem est quod
 via; vel accipitur ratione spatii in quo scribitur, et sic vocatur locus;

- 175 **Sciendum igitur** (15): assignat numerum figurarum, quae sunt per quas fit omnis numeratio et universaliter omnis alia species huius artis, et facit tria: primo enim ostendit quae et quot sunt figurae in universo significativae, et secundo (16) addit condiciones cuiusdam figurae non significativae, et tertio (18) probat sufficientiam figurarum. Secunda pars (16) incipit ibi *Decima vero*, tertia (18) ibi *Cum igitur per has*. – Dicit igitur primo (15) quod *secundum numerum novem limitum inveniuntur novem figurae significativae repraesentantes novem digitos, quae tales sunt: 9 8 7 6 5 4 3 2 1*. Quomodo autem novem digiti accipiuntur secundum novem limites, et quid sit limes in hoc loco, et quod limites non transcendunt numerum novenarium, dicitur in de radicum extractione {150}. – **Decima vero** (16): addit condiciones cuiusdam figurae non significativae, et primo facit hoc, secundo (17) removet dubium, cum dicit *Ipsa tamen locum*. – Dicit primo (16) quod decima figura habet quattuor nomina, quia *dicitur theta vel circulus vel cifra vel* 190 *figura nihili*; et subdit quare vocatur figura nihili, *quia nihil significat*, sed quare aliis nominibus vocetur, non dicit auctor, quia omnia alia nomina habet ratione suae lineationis sive figurationis, quia rotunda est. Dicitur autem haec figura theta ad similitudinem thetae: theta enim est ferrum figurae rotundae, quod ignitum imprimi solet in 195 quibusdam regionibus fronti vel maxillae furis vel latronis. Haec

mus ad aliquem terminum sic per calculationem istarum figurarum devenimus in cognitionem omnium numerorum *add. E 173* scripta hic: ECD; s. figura V; s. figura hic HBM; figura s. etiam figura dicitur circulus, quia est figurae circularis; vocatur etiam cifra quasi circumferia vel circumferentia, quod idem est quod circulus non habito respectu ad centrum. – **Ipsa tamen locum** (17): removel dubium: quia dixit quod haec decima vocatur propter hoc
 200 *figura nihili, quia nihil significat*, dubitaret forte aliquis quare inter figuras huius artis annumeretur; ideo removel hoc dubium, dicens quod, licet ipsa per se sumpta nihil significet, *ipsa tamen locum tenens*, id est occupans locum, *dat aliis significare*. Nam, sicut dicit auctor, *articulus purus non potest scribi sine cifra vel sine cifris*: sine cifra enim non
 205 scribitur aliquis articulus minor quam centum, et nullus alius articulus scribitur quin ibi sint duae cifrae vel ad minus una, sicut dicitur infra in hoc eodem capitulo; patet igitur quod, licet cifra per se nihil significet, *ipsa tamen dat aliis significare*. Decem igitur sunt figurae, novem significativae et decima non significativa. – **Cum**
 210 **igitur per has** (18): probat sufficientiam figurarum, scilicet quod non est opus plures figuras esse significativas quam has. Dicit igitur quod *cum per has novem figuras significativas, adiunctas quandoque uni cifrae, quandoque cifris pluribus, contingat quemlibet numerum repraesentare, ideo non fuit necesse plures figuras significativas inveniri*, quasi auctor sic argueret:
 215 tot figurae significativae sunt necessariae et non plures, quot, cifris additis, omnis numerus repraesentatur; sed omnis numerus per has novem figuras significativas repraesentatur, cifris additis; ergo tot figurae significativae et non plures sunt necessariae. – Nota quomodo Albus ad hoc devenire potuit, ut per has decem figuras omnis
 220 numerus repraesentetur: vidit enim quod omnis numerus crescendo vadit per X, ut ab uno ad X, ab XI ad XX, a XXI ad XXX etc., ita quod semper addendo digitos eosdem ad articulum habitum procedi-

tur ad articulum superiorem. Et ad hoc forte advertens Plato species numerorum dixit solum esse decem: "facit enim numerum usque ad decem", sicut dicit Philosophus tertio Physicorum, capitulo de infinito.

Notandum igitur etc. (19): dat regulas hanc speciem rectificantes et nos in hac specie dirigentes, et facit duo: primo enim dat tres regulas dirigentes nos in scribendo quemlibet numerum, et secundo (22) dat unam regulam dirigentem nos in legendo et pronuntiando quemlibet numerum scriptum; secunda pars est ibi *Notandum est etiam*. – Prima pars (19) habet tres partes iuxta numerum trium regularum: secunda (20) ibi *Omnis vero numerus*, tertia (21) ibi *Omnis quidem numerus*. Prima regula (19) sumitur per respectum ad figuras in se, secunda (20) per respectum ad ordinem et situm figurarum, et tertia (21) per respectum ad numerum figurarum. – Dicit ergo primo (19) quod *omnis digitus habet scribi per unam solam figuram sibi appropriatam; omnis vero articulus habet scribi per cifram primo loco positam et per digitum a quo denominatur ille articulus*: omnis enim articulus ab aliquo digito denominatur, ut denarius denominatur ab unitate, vigenarius a binario, etc. Nota hic quod, cum auctor dicit quod *omnis articulus habet scribi per cifram*, hoc intellegendum est de articulis principalibus, qui scilicet minores sunt quam centum: isti enim per unam cifram et digitum articuli habent scribi; sed omnis articulus a principalibus articulis usque ad mille scribitur per duas cifras primo positas et per digitum articuli. Item nota quod, quanto aliquid in hac tota arte numerandi est dexterius, tanto est prius, et quanto aliquid est magis versus sinistram, tanto est posterius; et ideo, cum dicit auctor quod cifra primo debet poni, intellegendum est sic quod debet poni ad dextram. – **Omnis vero numerus** (20): dat secundam regulam sumptam per respectum ad ordinem et situm figurarum, et patet; et

33. **223** Plato: philosophus S; om. M **224** dixit (dicit HB; dicitur M) solum esse: s.d.e. CEAD; d.e.s. T **230** dirigentem: -ntes V; def. C **231** pars est: p. incipit CT; p. S; om. HBD; def. converso. Removendo igitur hoc dubium (24) facit duo, secundum quod dat duas rationes. Et dicit auctor quod nos *in hac arte scribimus sinistrorsum*, id est versus sinistram, incipiendo a dextra; hoc autem facimus *more Arabum, qui hanc scientiam invenerunt*: prima ergo ratio
 305 quare in hac arte sic scribendum sit, haec est, quia Arabes, apud quos haec scientia inventa est, hoc modo scribunt, sicut etiam faciunt Hebraici [: vidi enim Iudaeum sic scribere]. Et tunc dat aliam rationem ad idem, et dicit quod hoc modo scribimus in hac arte, vel propter id quod iam dictum est, vel etiam hac ratione ut semper, pronuntiando
 310 aliquem numerum, maiorem numerum praeponamus minori secundum ordinem et modum consuetum in loquendo.

Ad intellectum igitur huius partis notandum quod nos Latini consueti sumus in loquendo seu pronuntiando aliquem numerum semper praemittere maiorem numerum minori, ut dicendo 24 vel 25
 315 praeponimus 20 ad 4 vel ad 5, et similiter dicendo centum decem vel centum triginta praemittimus centum ante decem vel triginta. – Item secundo suppono quod, quanto aliqua figura est sinisterior, tanto est posterior. – Item per praehabita sciendum quod, quanto aliqua figura fuerit posterior, tanto maiorem numerum repraesentat. – Cum
 320 igitur omnis numerus, quanto fuerit posterior, tanto est maior, per ultimum, et nos pronuntiando a maiori incipimus, per primum, in pronuntiando igitur incipiemus a posteriori. Ulterius, in pronuntiando incipiemus a posteriori, sicut probatum est; sed quanto aliqua figura est posterior, tanto est sinisterior, per secundum suppositum;

302 dat duas rationes: dat du. r. huius C; du. r. huius dat E; dat du. causas A et dicit auctor (*om.* D) quod (*si add.* C): et quod VHB^T; et quia S; quare A
303 autem (ac C): ideo *add.* ES **304** qui: quia hii EST ergo: autem ESTA
305 scribendum sit: s. est VHB^MS; scribamus A; scribimus D; *alia* C haec est: est CSD; sit ista A; *om.* VHB **307** vidi--scribere: iudaei enim iudaeum sic scribere docent HB; vidi autem ita arabes scribere et iudaeos D; *om.* CESTA
312 igitur: autem STA; *om.* et autem *ins.* E notandum: n. est CM; est n. ST
313 seu: sive CM; se V; vel AD **314** 24,25: 24,45 HB; 21,22 (xxi,xxii E) EA; 31,32 S; 21 T **315** 20 (xx E): 30 S ad₁: ante AM 4,5: unum, duo ESA; unum T vel ad: vel 40 ad B; vel HM; et ante A; *def.* T **316** triginta₁: EC; 30 V; 20 S decem: CS; x E; 10 V triginta₂: C; xxx E; 30 V; 20 S **318** sciendum quod: quod A; *om.* VCHBM **321** a maiori incipimus: i. a m. V; a m. C **322-3** ulterius--posteriori: *om.* ETAD, Cu **323** a posteriori: *om.* V; *def.* ETAD **324** tanto est (*om.* D; *om.* et *ins.* E) sinisterior (posterior M): *om.* VHB^ST; tanto minorem numerum repraesentat A secundum suppositum: secundo sup.

325 ergo pronuntiando incipiemus a sinisteriori. Sic igitur incipiendo
 consuetum ordinem servabimus in legendo, quia, praemittendo id
 quod sinisterius est, praemittimus numerum maiorem, sicut consueti
 sumus facere in pronuntiando aliquos numeros.

330 Ulterius nota hic diligenter quod Latini et universaliter omnes
 communicantes linguae Latinae, sicut sunt Lombardi et Gallici, et
 similiter Graeci, semper praeponunt maiorem numerum minori,
 cum pronuntiare debent aliquos numeros compositos ex digito et
 articulo vel ex duobus articulis differentibus: dicit enim Latinus vi-
 335 ginti duo vel centum viginti, praemittendo viginti ante duo et centum
 ante viginti, et similiter Lombardus, Gallicus et Graecus. – Sed haec
 regula fallit in sex numeris primis compositis: dicimus enim et nos
 Latini et Gallici et Graeci undecim, duodecim, tredecim, quattuor-
 decim, quindecim, sedecim, semper praeponendo digitum, cum
 tamen minor sit. Sed quare in his numeris sic oporteat minorem
 340 maiori praeponere, et quare in tot et non in pluribus, causa est
 rationabilis: et primo, quare in his numeris hoc oporteat fieri, causa
 est quia, sicut dictum est, haec ars computandi inventa est apud
 Arabes, qui in pronuntiando semper in omnibus numeris minorem
 numerum praeponunt maiori, et universaliter omnes barbari, scilicet
 345 Teutonici sive Alemanni, Anglici et omnes his in linguagio communi-
 cantes. Quia igitur Arabes in pronuntiando minorem numerum
 praeponunt maiori, ideo, cum ars numerandi primo ab eis sit nobis

tradita, in primis numeris eos sequimur, in quibus scilicet numeris
 maius et minus attenditur, sicut sunt numeri compositi primi. Sed
 350 quare in sex tantum? Dico quod hoc est quia haec ars numerandi
 perfectionem primo sortita est ab Arabibus: ideo eos sequimur in
 numero primo perfecto, scilicet in senario. Si igitur, ut credo, quae
 dicta sunt veritatem habent, non bene pronuntiant qui dicunt decem
 et sex, vel qui dicunt septem decem, octo decem, sicut quosdam
 355 audivi loqui; et hoc nota diligenter.

Additio est etc. (25): in hac secunda specie, quae est additio, facit
 auctor duo: primo enim declarat intentionem suam, et secundo (37)
 dat quoddam notabile hic et in omnibus aliis speciebus huius artis
 sequentibus observandum; secunda ibi *Notandum etiam*. Circa primum
 360 (25) duo facit: primo enim definit auctor additionem, et secundo (28)
 docet qualiter in ea est operandum, ibi *Si velis igitur numerum*. Adhuc
 prima (25) in duas: primo facit quod dictum est, secundo (26) tangit,
 quae et qualiter se habentia ad additionem exiguntur, ibi *In additione*.
 – Primo igitur (25) definit additionem, et cum hoc exprimit finem et
 365 utilitatem cui additio deservit. Dicit igitur quod *additio est aggregatio etc.*
 – haec est sua definitio seu descriptio – *ut videatur summa etc.*: per hoc
 tangit finem et utilitatem cui deservit. Si igitur aliquis habeat in
 aliquo loco 158 libras et in quodam alio loco 98 libras, et tunc scire

velit quantum illud est in universo, haec est utilitas additionis, et hoc
 370 fit aggregando unum numerum ad alterum vel unam summam ad
 alteram. – **In additione** (26): tangit, quae et qualiter se habentia ad
 additionem exiguntur. Et hoc innuebatur in descriptione additionis,
 quia, cum dixit (25) quod *additio est aggregatio numeri ad numerum*,
 innuebat quod exigitur unus numerus addendus et alius cui debet
 375 addi; et ideo facit hic (26) duo: primo enim dicit quod *duo ordines*
figurarum, id est duo numeri, sunt in additione necessarii, scilicet numerus, cui
debet fieri additio, et numerus addendus, et in hoc tangit quae ad
 additionem exiguntur; et secundo (27), cum dicit **Numerus cui**
debet fieri additio, tangit, qualiter se habentia ad additionem
 380 exiguntur, quia docet ibi, qualiter isti numeri ordinari debent; et
 patet sententia in littera.

Si velis igitur (28): docet qualiter in hac specie est operandum; et
 primo disponit figuras, et secundo (29) ipsis dispositis exsequitur de
 intento, cum dicit *Hoc autem facto*. – Dicit ergo (28): *Si velis addere*
 385 *numerum numero*, scilicet ut videatur summa totius, tunc *scribe numerum*,
cui debet fieri additio, in superiori ordine, id est superius, *per suas differentias*,
id est figuras, etc., ita quod prima inferioris ordinis sit sub prima superioris
ordinis etc. Esto igitur quod tu velis scire summam quae provenit ex
 additione 98 ad 158; tunc ordinabis hoc modo figuras¹⁵⁸₉₈. Sicut enim
 390 dictum est superius, quanto aliqua figura est dexterior, tanto est
 prior, et ideo 8 in utroque ordine est figura prima, et 9 in inferiori
 ordine est secunda, et 5 in superiori ordine est secunda.

Hoc autem facto (29): exsequitur de modo operandi, figuris dispositis. Et quia additio completur et perficitur addendo quamlibet inferioris ordinis ad figuras superioris ordinis, ideo auctor duo facit: primo enim (29) docet operari addendo primam inferioris ordinis ad primam superioris ordinis, et secundo (36) innuit operationem eandem et eundem modum operandi in aliis figuris, cum dicit *Hoc facto secunda secundae*. Item, quia addendo numerum ad numerum semper resultat numerus tertius diversus, ideo auctor circa primum (29) duo facit: primo enim, addendo primam figuram numeri inferioris ad primam numeri superioris, ostendit sive praemittit quandam divisionem circa numerum excrescentem ex additione primae ad primam; et secundo (30) docet, quomodo circa unum-quodque membrorum dividendum sit agendum, cum dicit *Si digitus*. – Dicit igitur primo: *Hoc facto*, id est, cum sic ordinaveris figuras, addatur prima figura inferioris ordinis primae figurae superioris ordinis. Ex tali igitur additione aut excrescet digitus etc. – **Si digitus** (30): exsequitur de membris dividendis, docens iuxta singulum operari, et facit tria secundum tria membra datae divisionis: primo enim dat modum operandi cum numerus excrescens fuerit digitus; et secundo (31), si fuerit articulus; et tertio (35), si fuerit numerus compositus. Secunda pars (31) statim post, cum dicit *Si articulus*; et tertia (35) ibi *Si excrescat numerus compositus*. – Vult primo (30) dicere quod, si addendo primam inferioris ordinis ad primam superioris proveniat digitus, tunc prima superioris ordinis debet deleri, et loco eius ille digitus poni [qui provenit ex tali additione]. Verbi gratia, si prima superioris ordinis esset 4 et prima inferioris ordinis esset 3, tunc addendo 3 ad 4 excrescent 7, quae sunt quidam digitus, qui loco quaternarii debet poni

420], scilicet ipso quaternario deleto]. – **Si articulus** (31): docet, qualiter sit operandum, si excrescat articulus. Et hic notandum quod, quia locus primus non est locus articuli, sicut dictum est in capitulo praecedenti (20), ideo oportet articulum versus sinistram ponere in loco secundo. In loco igitur secundo aut est figura aliqua aut nulla; 425 item, si aliqua, aut significativa aut non; item, si significativa, aut est 9 aut alia figura a novenario. Hanc divisionem innuit auctor, docens iuxta quodlibet membrum eius operari, et facit quattuor: primo enim (31) docet, quid generaliter sit faciendum, si in loco secundo fuerit figura; et secundo (32), quid sit faciendum, si non sit ibi figura aliqua; 430 et tertio (33) in speciali docet, si in eodem loco secundo sit cifra, quid tunc sit agendum; et quarto (34), quid faciendum sit, si in secundo loco fuerit novenarius. Secunda pars (32) incipit ibi *Sin autem*; tertia (33) ibi *Si autem contingat*; et quarta (34) ibi *Si sit figura 9*. – Vult igitur dicere primo (31) quod, si ex additione primae ad primam proveniat 435 articulus, ut si superior fuerit 7 et inferior 3, vel superior 8 et inferior 2, et sic de aliis, tunc superiori deleta loco eius scribi debet cifra; et digitus, a quo denominatur articulus excrescens, addi debet ad figuram sequentem versus sinistram, si aliqua figura sequatur. Nota hic quod articulus proveniens ex additione alicuius figurae cuius- 440 cumque ad aliquam aliam quamcumque semper est denarius, et ideo digitus addendus ad figuram sequentem semper est unitas; si igitur in loco secundo fuerit ternarius, iam erit quaternarius, et si fuerit quaternarius, iam erit quinarius, etc. – **Sin autem** (32): docet, quid faciendum sit de articulo proveniente ex additione primae ad

445 primam, si in secundo loco non sit figura aliqua; et continuetur sic: si
 figura sit in loco secundo, addendus est sibi digitus articuli; *sin autem*,
 id est, si nulla sequatur, *ponatur* ille digitus *in loco vacuo*, id est in
 spatio vacante; et illud habet locum, quando in numero, cui debet
 fieri additio, non est nisi una figura. – **Si autem contingat** (33):
 450 docet, quid agendum sit, quando in secundo loco fuerit cifra, et
 patet. – **Si sit figura novenarii** (34): docet, quid agendum sit, cum
 in secundo loco fuerit 9, et patet; sed utaris hoc exemplo, quia esto
 quod numerus sit iste 397, cui addere velis 3. Ex additione igitur 3 ad
 7 proveniunt 10; unitatem igitur, a qua denominatur ille articulus,
 455 addas ad figuram sequentem, scilicet ad 9. Quia igitur haec unitas
 valet decem et ille novenarius valet nonaginta, provenient 100, quae
 non capiuntur in loco secundo; et ideo debet 9 deleri et loco sui
 poni cifra, et unitas addenda est ad figuram sequentem, et tunc
 stabunt figurae sic 400. – **Si excrescat numerus compositus** (35):
 460 docet operari, cum numerus excrescens fuerit compositus, et ex dictis
 patet. Verbi gratia, sit numerus iste 349, cui addere oportet 7.
 Addendo igitur 7 ad 9 resultant 16, quod est numerus compositus;
 deleas igitur 9 et loco eius scribas 6, qui est altera pars illius numeri
 compositi, scilicet digitus; et unitatem addas ad 4 pro illo digito
 465 articuli, qui est altera pars illius numeri compositi; et facta additione
 stabunt figurae sic 356. Et iam visi sunt omnes casus qui contingere
 possunt in additione primae ad primam. – Et tunc, cum dicit **Hoc**
facto (36), innuit eundem modum operandi in additione secundae ad
 secundam, et sic de aliis, quia nihil debet immutari; quia, si ex
 470 additione secundae inferioris ordinis ad secundam superioris ordinis

numerus compositus, scilicet 11; deleas igitur 6, et loco eius ponatur
 495 unitas, quae est digitus illius compositi; et unitatem, quae est digitus
 articuli, ponas loco cifrae; et stabunt figurae post additionem primae
 ad primam isto modo $\begin{smallmatrix} 98711 \\ 12340 \end{smallmatrix}$. Quo facto addas secundam ad secundam,
 scilicet 4 ad 1, et resultat digitus, scilicet 5, qui ponatur loco unitatis,
 et stabunt figurae sicut hic sunt $\begin{smallmatrix} 98751 \\ 12300 \end{smallmatrix}$. [Addita autem secunda ad
 500 secundam, loco figurae additae, sive quae est addenda, poni debet
 cifra, ne figurae sequentes minus significant; et hoc intellegas de
 omnibus aliis sequentibus figuris.] Deinde addas tertiam ad tertiam,
 scilicet 3 ad 7, et excrescet articulus, scilicet denarius; loco igitur 7
 deleti ponatur cifra, et unitas, quae est digitus articuli, addatur ad
 505 figuram sequentem, scilicet ad 8, et stabunt figurae hoc modo $\begin{smallmatrix} 99051 \\ 12000 \end{smallmatrix}$.
 Hoc facto addas quartam ad quartam, scilicet 2 ad 9, et excrescent
 11; unitatem igitur ponas loco 9, et unitatem, quae est digitus articuli,
 addas ad 9 sequentem, et erunt 10; dele igitur 9 et loco eius ponas
 cifram, et unitatem, quae est digitus articuli, ponas in spatio vacante
 510 ad sinistram, hoc modo $\begin{smallmatrix} 101051 \\ 10000 \end{smallmatrix}$. Deinde addas ultimam figuram ad sibi
 suprapositam, scilicet unitatem ad 0, et erit 1; ergo unitatem ponas
 loco cifrae. Et stabunt sic omnes figurae numeri aggregati ex
 additione numeri addendi ad alium: 111051, qui continet in se
 utrosque numeros primo propositos.
 515 Quod si scire velis utrum bene addidisti, tunc haec diligenter notes:
 accipe numeros primo propositos, scilicet 98706 et similiter 12345, et
 utendo qualibet figura ac si per se poneretur, <colligas omnes simul,>
 abiciendo semper 9. Verbi gratia, numerus addendus erat talis 12345.
 Colligas omnes figuras simul, et erunt 15; abicias ergo 9, et remanent

 pars (om. A) incipit (om. EA) ibi ESTA 540 duo: quia add. EST 541 cum

545 (40) incipit ibi *Minor autem de maiori*, tertia (42) ibi *In subtractione*. Adhuc primo (38) facit duo, secundum quod dat duas definitiones subtractionis; secunda (39) ibi *vel subtractio est*. [Haec est divisio.] – Dicit primo (38) quod *subtractio est, propositis duobus numeris, inventio excessus maioris numeri ad minorem*. Verbi gratia, si habeat aliquis 99
550 libras et teneatur creditori in 64, tunc ad hoc quod sciatur, deductis his 64 quantum remanet de 99, valet haec species. Propositis igitur talibus duobus numeris, subtractio est inventio cuiusdam numeri in quo maior excedit minorem; inventio igitur illius excessus est utilitas huius speciei, et hoc est quod secunda definitio (39) clarius dicit: **vel**
555 **subtractio est**, quod patet de se.

Minor autem de maiori (40): condiciones definientium manifestat, et facit duo: primo enim facit quod dictum est, et <secundo> (41), quia locutus est de numero maiori et minori, dat artem cognoscendi, quis numerorum propositorum est maior, cum dicit *Ille quidem*. – Et
560 quia pars prima (40) patet de se, vade ad sequentem (41), ubi ex incidenti dat artem cognoscendi, quis numerorum propositorum est maior; et dicit quod *ille est maior, qui scribitur pluribus figuris, ultima existente significativa*. Verbi gratia, licet 9 sit maxima figurarum et 1 minima, tamen 4 unitates maiorem numerum repraesentant quam 3
565 novenarii. *Si autem tot sunt figurae in uno quot sunt in reliquo, iudicandum est per ultimas etc.*, quis eorum scilicet est maior vel minor: tot enim figuris existentibus in uno quot sunt in altero, ille totus est maior cuius ultima figura est maior; ut si sint isti duo numeri propositi 93

dicit: secunda ibi ESTA 544 pars incipit (om. C) ibi: ibi ETA; ibi cum dicit HB 547 haec est divisio (definitio A): om. VCHBD 548 dicit primo: p.d. HBS; d. ergo p. ET; d. igitur A 549 habeat aliquis: a.h. CD; h. quis VB; h. H 550 quod: ut VST; def. A

553 excedit: -dat EST 554 hoc: haec ESTA secunda definitio (descriptio omnes): d.s. CHBST; d. eius secundo A dicit: ibi cum dicit add. EST 557 et facit duo: et d.f. V; om. & ins. et 89, ille est maior cuius ultima est 9. Item, si tot sunt in uno numero quot sunt in reliquo, et tantum numerum repraesentat ultima unius quantum ultima alterius, tunc cuius paenultima est maior, totus est maior; ut si sint isti duo numeri propositi 983 et 973, ille est maior cuius paenultima est 8.

In subtractione etc. (42): ordinat se ad operandum, et facit tria: primo enim tangit, quot numeri sunt hic necessarii, et secundo (43) eos disponit in ordine quo eis in operando est utendum, et tertio (44) de operatione exsequitur; secunda pars (43) est ibi *Numerus a quo*, tertia (44) ibi *Subtrahe igitur*. Et patent partes duae primae (42-3). – Ubi auctor exsequitur de modo operandi (44), facit duo: primo enim dat modum subtrahendi primam inferioris ordinis a prima superioris ordinis, et secundo (51) innuit eundem modum in subtractione aliarum de aliis, cum dicit *Hoc autem facto*. Primo (44) facit duo: primo enim tangit diversas habitudines primae inferioris ad primam superioris, et secundo (45) iuxta quamlibet illarum habitudinum docet operari, cum dicit *Si par etc.* Et patet prima pars (44).

Et illa pars **Si par** (45) dividitur in tres partes iuxta numerum trium habitudinum primae ad primam, et incipit secunda pars (46) ibi *Si maior*, tertia (47) ibi *Si minor*. – Exemplum primae partis (45): sit numerus subtrahendus iste 248, numerus, a quo debet fieri subtractio, iste 688. Ordinentur igitur sic $\begin{array}{r} 688 \\ 248 \end{array}$. Cum igitur prima inferioris ordinis sit aequalis primae superioris, deleas superiorem et loco eius scribas cifram, et tunc stabunt figurae post subtractionem hoc modo $\begin{array}{r} 680 \\ 248 \end{array}$. Sed 0 ponitur loco superioris deletae, ne sequentes figurae eiusdem ordinis minus significant: alioquin enim, ubi deberent esse sexcenta octuaginta, non essent nisi sexaginta octo. – **Si maior** (46):

et 973--est 8: *om.* & *ins.* E; *def.* A 573 ille est maior: iste m.e. Exemplum huius est: sit numerus subtrahendus 248, numerus, a quo debet fieri subtractio, 469, et stabunt figurae sic ⁴⁶⁹248. Cum igitur prima superioris ordinis sit maior quam prima inferioris ordinis, demas de superiori 8 unitates, et residuum, scilicet unitatem, ponas loco eius, 600 et stabunt figurae sic ⁴⁶¹248.

Si minor (47): docet, qualiter sit negotiandum quando prima figura superioris ordinis fuerit minor quam prima inferioris; et quia maior de minori subtrahi non potest, ideo a sequenti loco mutuandum est quod deficit. Quia igitur figura secundo loco posita aliquando est 605 significativa, aliquando non significativa, ideo auctor hic duo facit, quia primo (47) docet operari, cum figura in secundo loco posita fuerit significativa, et secundo (49), cum non fuerit significativa, cum dicit *Si autem figura*. Circa primum (47) duo facit, quia primo docet operari, cum figura secundo loco posita fuerit aliqua alia ab unitate, 610 et secundo (48), cum fuerit unitas, ibi *Si vero figura*. – Dicit primo (47) quod *si minor* fuerit prima superioris ordinis quam prima inferioris ordinis, tunc, *quia maior de minori subtrahi non potest, mutuatur*, id est mutuo accipiatur, *unitas a figura proxima sequente, quae scilicet unitas valet X respectu figurae praecedentis*, scilicet primae, quia quaelibet unitas 615 in secundo loco posita valet X, ut dicebatur supra. *Ab illo igitur denario in secundo loco sub forma unitatis accepto et a figura, a qua in principio debuit fieri subtractio, simul iunctis subtrahatur figura inferior, et residuum etc.* Verbi gratia, sint numeri isti ⁴⁶³348. Cum prima superioris ordinis, scilicet 3, sit minor quam 8, quae est prima inferioris, 620 inferior de superiori subtrahi non potest: accipiatur ergo unitas de 6, quae est figura proxima sequens, et quia quaelibet unitas in hoc 6 valet 10, haec unitas valet 10; loco igitur 6 scribatur 5, et postea a

subtrahere, et ab eo quod mutuatum est; et tunc remanent 9, quae
 675 ponas loco secundo, scilicet loco binarii. Quo facto subtrahas tertiam
 de tertia, scilicet 4 de 1; sed non potes, ergo, cum in loco proximo est
 cifra, accipe unitatem de figura proxima post 0, et quia illa est unitas,
 deleas illam; sed non oportet loco eius ponere cifram, quia nulla
 figura sequitur. Quia igitur haec unitas valuit centum respectu figu-
 680 rae, a qua debuisti subtrahere, ideo de illis centum relinquis 90,
 faciendo 9 de cifra quae erat in via, et sic non remanet nisi denarius;
 ab hoc igitur denario adiuncto unitati, a qua debuisti subtrahere,
 subtrahas 4, et remanent 7, quae ponas loco unitatis. Deinde
 subtrahas quartam de quarta, scilicet 5 de 9, et remanent 4, quae
 685 ponas loco 9 deleti, et remanebunt hae figurae 4790.

Si igitur probare velis utrum bene subtraxisti (53), addas figuras
 quas subtraxisti ad figuras hic residuas, et redibunt eadem quae
 primo proponebantur. – Vel sic hoc probes, quia, si proba numeri
 residui et proba numeri, quem subtraxisti, fuerint aequales probae
 690 numeri, a quo subtraxisti, bene fecisti; est autem proba, sicut dictum
 est, residuum abiecto quotiens potest novenario; et erit proba
 utrobique 7.

Mediatio est etc. (55): exsequitur de quarta specie, quae est
 mediatio, et facit tria, quia primo definit mediationem, et secundo
 695 (57), quid requiritur tamquam obiectum operationis in hac specie,
 manifestat, et tertio (58) exsequitur de modo operandi. Et incipit
 secunda pars (57) ibi *In mediatione*, tertia (58) ibi *Si velis igitur*. –

676 sed: quia *add.* ESTA loco: secundo *add.* ESTA **677** cifra: VE; 0 S; 40

scilicet 3, ponas loco 7; et quia quaelibet unitas in secundo loco valet
 10, unitas quae remanet valet 10: pro medietate ergo eius addas 5 ad
 755 figuram primam, scilicet ad 4, sic 839. – **Si autem 0** (68): docet,
 qualiter medianda est secunda, cum ante eam loco primo fuerit 0,
 quia pro medietate unitatis quae remanet ponendus est quinarius
 loco 0 in primo loco. Ex iam dictis constat etiam, quid faciendum sit,
 si unitas fuerit in secundo loco, quia ea deleta loco eius scribatur 0, et
 760 5 addatur figurae primae eo modo quo dictum est. – **Et sic operan-**
dum (69): innuit idem esse faciendum in omnibus aliis figuris, sicut
 modo factum est circa secundam, et patet.

In hac specie utaris hoc exemplo ad omnes casus. Sit iste numerus
 mediandus 510321. Incipe igitur a prima, et quia illa est unitas, illa
 765 deleta loco eius scribatur 0, et signum dimidii, tale scilicet ∂ , ponatur
 extra in tabula, et tunc erunt istae figurae 510320. Deinde media
 secundam; quae igitur quia par est, loco eius deletae ponatur unitas,
 sic 510310. Deinde media tertiam, quae est impar, scilicet 3:
 medietatem igitur binarii, scilicet 1, loco eius ponas, et 5 addas ad
 770 figuram praecedentem, sic 510160. Deinde vadas ad quartam; quia
 igitur haec est cifra, praetermittatur intacta. Quo facto media paenul-
 timam, et quia haec est unitas, loco eius cifram ponas, et 5 ponas
 ante, loco 0 praecedentis, sic 505160. Deinde media ultimam, quae
 quia est impar, scilicet 5, loco eius ponas medietatem de 4, scilicet 2,
 775 et pro unitate quae remanet addas ad figuram ante, scilicet ubi 0 est,
 5. Et erit residuum totius istud 255160 et unum ∂ .

Quod si probare velis utrum bene mediasti, sumas probam residui,

«contentum» sic accipe numerum B cuius: scilicet *add.* CHBSTA 754 10₁;

et est 1 cum dimidio; quod si duplaveris, habebis 3, quae erant proba
 numeri primo propositi. Sed nota quod, si aliquando proba residui
 780 duplata excedat 9, abiectis 9 residuum erit proba numeri totalis
 primo propositi. Attamen non semper erit proba residui medietas
 probae totalis, licet residuum sit medietas totalis, ut in hoc numero
 12345: proba enim numeri totalis est 6, proba autem residui facta
 mediatione est 7 cum dimidio, quo duplato erunt 15, quorum proba
 785 est 6.

Duplatio etc. (70): [postquam auctor expedit se de quattuor
 speciebus huius artis, in ista parte] determinat de duplatione, quae
 est quinta species huius artis, et facit tria: primo enim definit eam,
 secundo (71) subiungit ea quae in hac specie sunt necessaria, et tertio
 790 (76) tradit modum operandi; et incipit secunda pars (71) statim post,
 cum dicit *In duplatione*, tertia (76) ibi *Si velis igitur*. – Prima pars (70)
 patet, nisi quod dicit *ad se ipsum*, propter differentiam huius speciei
 ad additionem, ubi indifferenter quilibet cuilibet aggregatur: omnis
 enim duplatio additio quaedam est, et non convertitur. Si igitur
 795 aliquis habeat aliquam summam, puta 999 libras, et tantundem
 accepturus est a debitore, ad sciendum summam totius valet haec
 species.

In duplatione etc. (71): subdit quae ad hanc speciem sunt neces-
 saria, et facit duo: primo enim dicit quod *unus ordo figurarum est hic*
 800 *necessarius*, et patet, et secundo (72) docet, ubi incipiendum est
 operari, cum dicit **Et inchoandum est**, et facit duo: primo enim

Sunt autem sex regulae, quarta (93) ibi Si velis igitur, quinta (111) ibi Sciendum autem, in fine capituli.

- Dicit igitur primo (81) quod *multiplicatio est, propositis duobus numeris, inventio tertii numeri qui etc.* Vult dicere quod, si proponantur duo
 875 numeri quorum unum velis multiplicare per alterum, tunc multiplicatio est inventio cuiusdam numeri tertii, *qui numerus tertius totiens, id est tot vicibus, continet alterum illorum propositorum, quot unitates sunt in reliquo.* Verbi gratia, si velis multiplicare 5 per 4, provenient 20, qui, scilicet numerus vigenarius, tertius est a duobus
 880 propositis; et iste totiens continet 5 quot unitates sunt in 4, et etiam totiens continet 4 quot unitates sunt in 5: viginti enim quater continet 5 vel quinquies 4, quod idem est. Multiplicare igitur unum numerum per alium est invenire quendam numerum tertium, qui totiens continet alterum illorum, quot unitates sunt in reliquo. Est autem
 885 haec species maxime utilis, quia esto quod rex aliquis † habeat in deposito magnam summam pecuniae, puta 99999 librarum, quam deputat aliquibus militibus, puta 666, quos mittat in expeditionem: ad sciendum igitur, quantum quilibet de hac summa habebit †, valet species hic tradita.
- 890 **In multiplicatione** (82): manifestat, quot ordines figurarum in hac specie sunt necessarii, et facit duo: primo enim facit quod dictum est, et secundo (85) per modum notabilis dat quandam cautelam hic observandam; et incipit secunda pars ibi *Notandum etiam.* Circa primum (82) duo facit: primo enim manifestat, quot numeri in hac
 895 specie sunt necessarii, et secundo (84) addit tertium quendam nume-

E; def. A 873 igitur: ergo CS; om. A; alia T 874 qui: om. EV; def. A proponantur: praep. ESA; pon. CT 877 id est: et VHBST; def. A 879 provenient: -iunt STA; alia HB 880 5: E; quinque HBS; def. rum, qui provenit ex duobus propositis, cum dicit *Potest etiam tertius numerus*. Adhuc circa primam partem (82) facit duo, quia primo facit quod dictum est, secundo (83) subiungit modum quo numeros istos denominabimus, ibi *Numerus multiplicandus*. - Circa primam partem
 900 (82) est sciendum quod numerus multiplicandus est ille qui debet multiplicari, numerus multiplicans est per quem alius est multiplicandus. - **Numerus multiplicandus** (83): subiungit modum quo numeros istos denominabimus, et patet. Verbi gratia, si velis multiplicare 6 per 4, dices in multiplicando sic: quater 6. - **Potest etiam**
 905 (84): addit quendam numerum tertium, qui resultat ex duobus quorum unus est multiplicans et alter multiplicandus, et patet. - **Notandum etiam** (85): per modum notabilis dat quendam cautelam hic observandam, et est quod, cum numerus aliquis debet per alium multiplicari, quocumque illorum velit poterit quis uti pro multiplicando, et similiter quocumque pro multiplicante, quia provenit idem
 910 ducendo 6 in 5 et 5 in 6.

Sunt autem sex regulae (86): assignat sex regulas hanc speciem rectificantes, et iuxta hoc haec pars in sex partes dividitur, quia primo (87) dat regulam ducendi digitum in digitum, secundo (88) digitum in articulum, tertio (89) digitum in numerum compositum, quarto (90) articulum in articulum, quinto (91) articulum in numerum compositum, sexto (92) numerum compositum in numerum compositum; nec pluribus modis est possibile numerum duci in numerum sive numerum multiplicari per numerum; et patent partes. Sed quia
 920 semper qualibet figura utimur ac si per se poneretur, ideo sola prima regula (87) est de esse huius speciei; sed aliae sunt quasi correlaria quaedam ex prima regula sequentia, sicut videbitur, quapropter quinque regulas ultimas reservabo ad finem capituli. - Quia igitur tota vis capituli iacet in prima regula, notes eam diligenter. Dicit
 925 igitur sic: **Quando digitum multiplicat digitum, subtrahendus est**

903 numeros istos: i.n.T; n. isto V; numerum HB velis: velimus HBSTA
 904 dices: dicemus HBSTA potest (post A); et cum dicit p. EST 907
 quamdam: om. VHB; def. A 909 velit poterit quis: v.p. HB; velis poteris V; def.

 relaria (A; -rie S): correlativa B; varie abbreviant cett. 922-3 cf. l. 1072 924
 notes eam diligenter: ideo d. est notanda ESTA dicit igitur: d. ergo VT; unde
 d. HB 925 sic: quod add. VHB 926 velis: velit aliquis (a.v. A) ESTA

etc., id est, si velis multiplicare unum digitum per alium, quorum unus est maior alio, tunc videndum est, per quot unitates maior digitus distet a 10 inclusive; et totiens debet minor subtrahi ab illo articulo, qui ab ipso minori digito denominatur. Verbi gratia, si velis
 930 multiplicare 8 per 4, vide per quot unitates 8 a 10 distet inclusive, et constat quod per duas unitates: ergo totiens, id est bis, subtrahas 4 de 40; cum igitur bis 4 sint 8, si 8 subtraxeris de 40, remanent 32, quod est intentum, quia quater 8 sunt 32. – Exponas litteram sic: *Quando digitus multiplicat digitum*, id est quando per digitum oportet multiplicare digitum, altero – supple – maiore existente et altero minore,
 935 *subtrahendus est minor digitus ab articulo suae denominationis*, id est ab articulo qui denominatur ab illo digito, *per differentiam maioris digiti ad denarium*, id est totiens vel tot vicibus, per quot unitates maior digitus distat a denario, *denario simul computato*, id est inclusive, vel annuendo etiam denarium; et subdit idem exemplum quod iam induxi. – Notandum quod auctor non facit mentionem de multiplicatione digiti eiusdem in eundem, sed solum loquitur de talibus quorum unus est maior et alter minor. Esto igitur quod tu velis multiplicare eundem per se vel in se, quod idem est, verbi gratia 8 per 8; tunc,
 945 quia idem est iudicium de utroque, per quot unitates 8 distat a 10 inclusive, totiens subtrahas 8 de 80; et patet, quid ulterius faciendum est, per ea quae prius dicta sunt. – Item nota virtutem et significatum illius quod dixit: *per differentiam maioris ad denarium*. Differentia duorum numerorum est id in quo maior excedit minorem: verbi gratia, quia denarius excedit 8 in duobus, ideo dicimus duo esse
 950 differentiam 8 ad denarium. Et ideo credo vere quod non oportebit addere *denario simul computato*, immo credo quod haec sit glosa inserta textui ex pravo intellectu illius "differentiae" minoris numeri ad

927 quot: quod ESA; quos T **928** digitus: numerus A; *om.* VHB distet: differet A; distat VHB 10: VHB; x E; decem S **930** 8 a 10 (V; decem HBS; x E) distet: 8 distat a 10 V; distat 8 a decem HB; *def.* A **932** sint: sit V; sunt S; *def.* A subtraxeris: subtrahas HBS; *def.* A **935** supple: supp() ET; sup() H; s(cilicet) B; s(em)p(er) S; *def.* A **939** id est: vel S; *om.* C; *def.* A **940** induxi: induxisti V; induxit S; dixi T; *def.* A **941** auctor non facit: a.n.f. hic ET; hic a.n.f. maiolem. – Item nota quod, licet haec regula sit generalis ad omnes
 955 digitos, in parvis tamen digitis non est per eam laborandum, quia, si
 debeas multiplicare 3 per 3 vel 3 per 4, quilibet rudis statim sciret
 quantum provenit.

Et tunc, omissis quinque regulis sequentibus, vadas ad locum illum
Si velis igitur (93), in qua dat auctor modum operandi, et facit duo:
 960 primo enim docet ordinare figuras numerorum, quorum unum
 oportet in alium ducere, et secundo (94) exsequitur, cum dicit *quo
 facto etc.*; patet autem pars prima (93) secundum litteram. Sed
 exemplum accipiatur sic: esto quod numerum istum scilicet 987 velis
 multiplicare per istum 654; tunc hoc ordine stabunt figurae ⁶⁵⁴987. –
 965 **Quo facto** (94): exsequitur; et quia omnes figurae numeri multipli-
 cantis debent duci in quamlibet figuram numeri multiplicandi, ideo
 docet primo ducere omnes figuras numeri multiplicantis in ulti-
 mam numeri multiplicandi; et secundo (101) docet ducere omnes
 easdem figuras numeri multiplicantis in paenultimam numeri multi-
 970 plicandi et in consequenter se habentes, cum dicit *Hoc autem facto*;
 tertio (106) subdit quasdam cautelas hic observandas in operando, ibi
Si autem contingat. Adhuc circa primam partem (94) duo facit, quia
 primo docet ducere ultimam figuram numeri multiplicantis in
 ultimam multiplicandi, et secundo (98) alias consequenter se
 975 habentes numeri multiplicantis in eandem ultimam multiplicandi;
 secunda ibi *Hoc facto*. Adhuc primo (94) facit duo: primo enim ponit
 casus provenientes ex ductu ultimae in ultimam, et secundo (95)
 iuxta quemlibet casum docet operari, cum dicit *Si digitus*; prima pars
 (94) patet. **Si digitus** (95): docet, quid in unoquoque casuum sit

1003 duas partes: p.d. S; duas (d) ETA) CETA; [[tres]] p.d. D 1008 exse-

(103) exsequitur modum operandi iuxta quemlibet illorum casuum, cum dicit **Si digitus**; et patent ambae partes. – **Similiter quaelibet**
 1010 **figura** (104): docet ducere omnes alias ab ultima numeri multiplican-
 tis in eandem paenultimam numeri multiplicandi, et patet in littera. –
Deinde ut prius (105): docet, quid agendum est in ductione
 omnium figurarum numeri multiplicantis in omnes figuras alias ab
 ultima et paenultima numeri multiplicandi; et dicit quod eodem
 1015 modo faciendum est, sicut modo factum est circa ultimam et
 paenultimam, quia *non est cessandum ab anterioratione* figurarum numeri
 multiplicantis, *nec cessandum est a ductu* omnium figurarum numeri
 multiplicantis in illam sub qua est prima multiplicantis, *donec quaelibet*
figura numeri multiplicantis ducatur in quamlibet figuram numeri multiplicandi.
 1020 – **Si autem contingat** (106): postquam docuit, qualiter est hic
 operandum, subdit consequenter quasdam cautelas hic observandas,
 et sunt quinque; secunda (107) ibi **Si autem occurrat cifra**, tertia
 (108) ibi **Sed si sit spatium**, quarta (109) ibi **Si autem cifra**, quinta
 (110) ibi **Ex praedictis etiam patet**; et cautelae omnes istae
 1025 videbuntur in exemplificando. – **Sciendum est autem** (111): ponit
 quoddam notabile, quod spectat ad bene esse huius artis quantum ad
 hanc speciem et divisionem et radicum extractionem, et patebit in
 exemplo.

Utaris igitur hoc exemplo in operando iuxta quemlibet casuum
 1030 incidentium in hac specie. Sit numerus, quem velis multiplicare, iste
 45060, et numerus multiplicans, scilicet per quem velis illum alium
 multiplicare, sit iste 2030. Ordinabis igitur figuras, ut stent isto modo
 2030⁴⁵⁰⁶⁰. Duc igitur ultimam in ultimam, scilicet 2 in 4, sic dicendo:
 bis 4, et resultat digitus, quem ponas supra caput ipsius 2 in ordine

quitur modum: prosequitur de modo HB 1011 in littera: 1. VCHBA

 n.l. E₂ ut stent: et stent ST; [[ut in]] A; om. C isto: illo EV; hoc C 1033
 duc: ducas (-cat Aa.c.) ESTA 1034 supra: super ECS 2: 4 C; binarii E; 2ⁱⁱ.

- 1035 numeri multiplicandi sicut hic: $\frac{8}{2030} \cdot \frac{45060}{2030}$. Quo facto, quia non valet ducere paenultimam in ultimam, cum ipsa paenultima sit 0, ideo super caput eius pone 0 iuxta tertiam cautelam (108) sic $\frac{80}{2030} \cdot \frac{45060}{2030}$. Deinde ducas 3 in 4, et resultat numerus compositus, scilicet 12; ponas igitur 2 supra 3, et articulum loco 0 versus sinistram, sic
- 1040 $\frac{81245060}{2030}$. Deinde ducas primam numeri multiplicantis in ultimam numeri multiplicandi, et quia illa prima est 0, deleas superiorem, scilicet 4, et ponas ibi 0 iuxta primam cautelam (106), et stabunt figurae sic $\frac{81205060}{2030}$. Quo facto anteriorandae sunt figurae numeri multiplicantis per locum unum, et stabunt post anteriorationem
- 1045 isto modo ordinatae $\frac{81205060}{2030}$. Quo facto ducas iterum omnes figuras numeri multiplicantis in illam figuram sub qua est prima numeri multiplicantis, scilicet in 5, et quidquid excreverit addas ad figuras suprapositas. Duc ergo ultimam numeri multiplicantis in illam sub qua est prima numeri multiplicantis, scilicet 2 in 5, et provenit
- 1050 articulus, scilicet denarius; et quia figura significativa est supra duo, non oportet ibi ponere 0, cum 0 non ponatur alicubi nisi ut locus occupetur; ideo illum articulum addas ad 8 versus sinistram. Quo facto, quia proxima figura numeri multiplicantis est 0, praetermittatur intacta, sicut dixit cautela secunda (107); de residuis autem,
- 1055 scilicet de 3 et 0, numeri multiplicantis fac ut prius. Et stabunt figurae istae hoc modo ordinatae et superius et inferius $\frac{91330060}{2030}$. Hoc facto iterum anteriorandae sunt figurae numeri multiplicantis per unum locum; et quia figura proxima illi, sub qua est prima numeri multiplicantis, est 0, non oportet sub eam anteriorare, et ideo anteriorandae sunt figurae numeri multiplicantis per duo loca, sicut dixit
- 1060

A.p.c. 1035 sicut hic: sic hic V; sic C 1037 sic: isto (illo A) modo (sive ordine *add.* ET) ESTA 1039 supra: super SA; *om.* C 1043 sic: sic ordinatae etc. S; hoc modo ordinatae VHB 1045 isto modo ordinatae: ET; sic V; sic etc. S; hoc modo B; *vacat* C; *om.* H; *def.* A 1046 qua est: alia 2 C; *def.* V, A numeriz; *om.* C; *def.* V, A 1047 in: *om.* VC; *def.* A 1048 numeri multiplicantis: m.n. 1180 est quod, quidquid est directe supra aliquam figuram et ab eadem in
superiori versus sinistram, dicitur esse supra inferiorem, et a toto
debet fieri subtractio; quod autem est versus sinistram, vocat auctor
residuum. Item nota, quare non contingit pluries subtrahere quam
novies nec minus quam semel: causa huius est quia, quotiens fit sub-
1185 tractio, hoc significabit figura in numero quotiens, sicut statim
dicitur; et nulla est figura quae plus significet quam 9, et nulla quae
minus quam unitatem, ideo et cetera.

Viso igitur (118): docet iuxta hoc praeambulum operari; et est
intellegendum quod, quia, quotiens poterit ultima subtrahi de
1190 ultima, totiens et quaelibet alia de sibi supraposita, ponenda est
quaedam figura supra numerum dividendum significans quotiens
inferiores de superioribus subtrahi possint; et ideo figura illa et
omnes illius tertii ordinis quotiens vocantur. Facit igitur auctor duo:
primo enim (118) docet invenire quotiens primum et iuxta ipsum
1195 operari, et secundo (119) alia et iuxta ea operari, cum dicit *Hoc autem
facto*. – Dicit igitur primo (118): *cum tu videris, quotiens figurae inferioris
ordinis possint subtrahi a superioribus, scribatur numerus seu figura denotans,
quotiens illa subtractio est possibilis; scribatur, inquam, directe supra illam
figuram, sub qua est prima figura numeri divisoris seu ordinis inferioris; et*
1200 *per illam figuram subtrahendae sunt omnes figurae inferioris ordinis a suis
superioribus*. Verbi gratia, esto quod numerus dividendus sit iste qui
supra 9876, et numerus, per quem velis eum dividere, sit ille ut supra
543. Situentur igitur hoc modo ⁹⁸⁷⁶₅₄₃. Videas igitur, quotiens poteris 5

de 9 subtrahere, et constat quod semel, et alias similiter de suis
 1205 superioribus. In signum igitur huius quod semel hoc poteris, ponas
 unitatem supra 7, quia sub ea est prima figura divisoris, et stabunt
 figurae isto modo $\frac{9876}{543}$. Quo facto per unitatem illam subtrahas
 omnes figuras inferioris ordinis a superioribus, ducendo eam in
 quamlibet inferioris ordinis per modum multiplicationis, sic dicendo:
 1210 semel 5 sunt 5, quae tollas de 9, et remanent 4; iterum semel 4 sunt
 4, quae tollas de 8, et remanent 4; iterum semel 3 sunt 3, quae demas
 de 7, et remanent 4. Et stabunt figurae sic post subtractionem $\frac{4446}{543}$.

Hoc autem facto (119): docet invenire quotiens alia a primo, et
 facit duo: primo enim innuit eodem modo esse faciendum post
 1215 anteriorationem figurarum primam, et secundo (121) docet, quamdiu
 invenienda sunt quotiens et quamdiu sit anteriorandum, cum dicit
Nec cessandum. Primo (119) adhuc duo facit: primo enim facit quod
 dictum est, secundo (120) dat quandam cautelam hic observandam,
 ibi *Si autem contingat*. – Dicit primo (119) quod *hoc facto*, id est invento
 1220 quotiens primo et facta per ipsum subtractione omnium figurarum
 inferiorum de superioribus, *anteriorandae sunt figurae numeri divisoris per
 unam differentiam, et negotiandum est ut prius*. Verbi gratia, invento primo
 quotiens et facta per ipsum subtractione omnium figurarum inferio-
 rum a superioribus, stabunt figurae sic $\frac{4446}{543}$. Anteriores igitur inferio-

dividas igitur hunc per numerum multiplicantem, scilicet per 2030, et exhibunt in numero quotiens 45060, quae figurae prius erant in numero multiplicando.

Operatio autem in divisione etiam sine multiplicatione divisoris per
 1300 quotiens probari poterit, sicut e converso factum est in fine capituli
 de multiplicatione: quia sumatur proba numeri dividendi, divisoris et
 numeri quotiens, et duc probam divisoris in probam numeri quo-
 tiens; et provenientis sume probam, quae si aequalis fuerit probae
 numeri dividendi, bene actum est. Verbi gratia, numerus primo pro-
 1305 positus dividendus sit iste 56088, cuius proba est 0; sit divisor iste
 123, cuius proba est 6; facta igitur divisione erit numerus quotiens
 iste 456, cuius proba est etiam 6; duc ergo probam numeri divisoris
 in probam numeri quotiens, et provenient 36, quorum proba est 0,
 sicut etiam est proba numeri dividendi. – Verumtamen, facta divi-
 1310 sione si aliquid fuerit residuum, aliquid aliud est faciendum: quia
 videas probam illius residui, et eam tollas de proba totius numeri
 propositi primo <dividendi>, si poteris; si non, tunc probae numeri
 totalis addas 9 et postea subtrahas probam residui; et tunc duc
 probam numeri divisoris in probam numeri quotiens, et provenientis
 1315 probam sume, quae si fuerit aequalis probae numeri primae, bene
 fecisti. Verbi gratia, numerus propositus primo dividendus erat iste
 9876, cuius proba est 3; numerus autem divisor erat iste 543, cuius
 proba etiam est 3; numerus vero quotiens erat iste 18, cuius proba est

Progressio est etc. (125): haec est octava species, quae est insuffi-
 1325 ciens, quia se non ad omnem numerum extendit et undecumque
 inceptum; ideo loco huius capituli istud, si placet, pro textu habeatur:

(1*) *Progressio est numerorum secundum aequales excessus augmentatorum
 aggregatio, ut universorum summa compendiose habeatur.* (2*) *Unde, si ex
 aggregacione numeri ultimi cum primo resultat numerus par, per eius medietate*
 1330 *tem multiplicetur numerus locorum; (3*) si vero impar, per eum multiplicetur
 medietas numeri locorum, et exhibit summa quaesiti.*

In hoc brevi capitulo duo fiunt: primo enim (1*) describitur
 progressio, secundo (2*) de ea dantur duae regulae, per quas haec
 tota species regulatur; secunda ibi *Unde si ex aggregacione.* – Dicit primo
 1335 (1*) quod *progressio est aggregatio numerorum augmentatorum secundum
 aequales excessus, ut summa universorum aggregatorum compendiose,* id est
 breviter, *habeatur.* Verbi gratia, si proponatur 1,2,3,4,5,6, quantum est

primo membro investigat, quis sit numerus quadratus, et secundo (137), quae sit eius radix, cum dicit *Radix autem*.

- Primo igitur (136) investigat, quis sit numerus quadratus, sub
 1415 quadam subdivisione membri primi, quia, *si numerus semel ducatur in numerum, aut ducitur in se ipsum aut in alium; si in se ipsum, fit numerus qui quadratus dicitur; si in alium, fit numerus superficialis non quadratus*. Quasi diceret quod numerus quadratus est sub superficiali, et superficialis non quadratus est sub eodem superficiali; quia superficialis absolute
 1420 est ille numerus absolute etiam, qui ex ductu numeri in numerum semel provenit, sed superficialis specialis fit secundum quod est proveniens ex ductu numeri non cuiuslibet in quemlibet, sed numeri in quendam alium. Et est simile: sicut enim, sub animali si essent duae species solum, puta homo et quodcumque aliud ab homine
 1425 [, tunc cum quodcumque aliud ab homine] non habet forsitan impositum unum nomen, tunc dividendo animal contingeret sic dicere "animalium quoddam est homo; quoddam est animal non homo", recte sic est in proposito, ut patet. – *Et vocatur numerus quadratus*, sicut dicit auctor, *quia divisim scriptus per unitates* constituit quadratum; verbi
 1430 gratia, iste numerus est quadratus scilicet 4, et scribitur 4 unitatibus sicut hic ::; et 9 est numerus quadratus et scribitur in 4 lateribus aequalibus per 9 unitates, sic ::::; et ita de aliis. Sed in superficiali non quadrato non fiunt omnia latera aequalia; verbi gratia, senarius provenit ex ductu ternarii in binarium et scribitur 6 unitatibus, sic :::: .
 1435 Constat quod latera non sunt aequalia: in uno enim sunt duo puncta et in alio tria, opposita autem solum aequalia sunt; unde senarius bene est numerus quadrangulus, sed non quadratus. Unde, sicut

igitur E; def. S 1416 fit: tunc est C; est A; sic est cett.; fit est Cu 1417 fit: def. CA; sic est cett.; fit est Cu 1418 diceret: d(icens) ET; dicet(ur) quasi dicat V; alia HB; diceretur Cu numerus quadratus: q.n. EV 1420 absolute etiam: e.a. ST; a. E; om. A; def. quadrangulum est superius ad quadrangulum quod est quadratum et quadrangulum non quadratum, sic superficialis est superius ad
 1440 numerum superficialem qui est quadratus et qui non est quadratus; et ideo dicit auctor quod *omnis quadratus est superficialis, sed non convertitur*. – **Radix autem** (137): ostendit, quae est radix numeri quadrati, et patet.

Si autem numerus bis ducatur (138): pertractat secundum
 1445 membrum dictae suae divisionis, scilicet quod aliquis numerus provenit ex ductu alicuius numeri bis in numerum, vel etiam quod aliquis numerus bis ducitur in numerum; ex quo membro elicit, quis sit numerus cubicus et quae eius radix. Et primo (138) quasi in generali pertractat membrum hoc, notificans, quis est numerus in
 1450 genere, qui provenit ex ductu numeri in numerum bis, absolute loquendo, non contrahendo ad eundem vel ad alium; et secundo (140) quasi specialiter descendendo sub illo numero membrum praedictum subdividit, ibi *Sed numerus potest dupliciter*. Adhuc primo (138) facit quod dictum est, et secundo (139) dat rationem impositionis
 1455 nominis huius, quod est solidus, qui est numerus ille absolutus; et incipit secunda pars ibi *Et dicitur solidus*. – Dicit igitur primo (138) quod *si numerus ducatur bis in numerum, constituet solidum, aut, pro "quia", numerus solidus est qui provenit ex duplici ductu numeri in numerum, scilicet non contrahendo ad eundem vel ad alium: sic enim habentur*
 1460 species sub solido. – **Et dicitur solidus** (139): haec pars plana est.

Sed numerus potest dupliciter (140): specialiter descendendo sub solido membrum hoc subdividit, constituendo species sub

quadrangulus: quadrangularis CHBEA 1439 quadrangulum (-glati HB) non quadratum: VHBS; quadrang. quod (quod qua. E; qua. om. C) non est (e.n. T) quadrat. 1490 sit linea trium pedum sive punctorum. Ducantur ergo haec tria
 puncta in se, et fiunt 9, qui est numerus quadratus mensuratus
 numero duplici, scilicet ternario bis sumpto; et ideo, quasi linea
 1495 trium pedum flueret ad tantam distantiam in ante, quanta est eius
 longitudo, constituitur quaedam superficies more mathematicorum
 loquendo. Deinde in eadem 9 ducatur eadem linea, ac si in deorsum
 fluens secum totam superficiem hanc trahens ad tantam distantiam
 1495 descenderet, quanta est eiusdem lineae longitudo sive totius super-
 ficiei latitudo; et sic quasi corpus quoddam constitutum est, quod sic
 factum habebit in qualibet 6 superficialium 9 et in quolibet 12
 laterum tria puncta, et ab angulo quolibet in angulum oppositum in
 quamcumque partem habebit etiam tria puncta; et ideo merito hic
 numerus cubicus est vocatus.

1500 **Si vero aliquis numerus** (143): pertractat membrum secundum,
 notificans, qualiter appellandus sit numerus qui ex opposito distin-
 guitur contra numerum cubicum; et primo facit hoc, secundo (144)
 comparat numerum cubicum ad solidum, cum dicit *Unde patet*. –
 Primo igitur (143) dicit quod *si numerus bis ducatur non in se, sed in*
 1505 *alium, fit numerus solidus non cubicus*, et ut legatur sub uno, dicit
 secundo (144), comparando numerum cubicum ad solidum, quod
omnis numerus cubicus est solidus et non e converso; et haec est comparatio
 speciei ad genus, sicut superius erat de quadrato et superficiali.

1510 **Ex praedictis etiam patet** (145): per comparisonem ad radicem
 numeri quadrati ostendit, quae est radix numeri cubici. Unde dicit
 quod *sicut ex praedictis patet, idem numerus est radix quadrati et cubici*: hoc

ergo ES 1487 sive punctorum: vel p. C; sex p. A; fi(eri) p(otes)t eor(um) E; def.

 sed non V; non C; def. A 1509 etiam: CE; igitur VSTA; ergo HB 1511
 patet: quod add. CS radix quadrati et cubici: r. numeri q. (om. V) et cu. VHB;

ex praedictis patet, cum idem est per dicta prius ducere numerum bis in se vel semel in suum quadratum. Et subdit quod tamen *idem quadratus et cubicus non sunt unius* et eiusdem *radicis*: verbi gratia, iste
 1515 numerus scilicet 729 et est quadratus et cubicus, sed non idem numerus est eius radix ut est cubicus et ut est quadratus; immo, ut est quadratus, radix eius est 27, ut autem est cubicus, radix eius est 9. Et similiter iste numerus scilicet 4096 et est quadratus et cubicus, non
 1520 tamen idem numerus est eius radix ut est quadratus et ut est cubicus; immo, ut est quadratus, eius radix est 64, et ut est cubicus, eius radix est 16. – Et subdit (146) quod *etiam patet quod omnis numerus est radix quadrati et cubici*, quod patet ex hoc quia, cum numerus non stat in sursum, quemcumque numerum contingit ducere in se semel, contingit eundem ducere in se bis; *sed non tamen omnis numerus est*
 1525 *quadratus vel cubicus*, quia superficialium quidam est quadratus et quidam superficialis non quadratus; item solidorum quidam est cubicus et quidam solidus non cubicus, sicut patet per praedicta.

Cum igitur ex ductu etc. (147): removet dubium, quod sic ex dictis ortum habet: dixit enim (137) quod *4 est primus numerus*
 1530 *quadratus, et radix eius est 2*, ex quo sequitur quod 2 est prima radix et minima; ex isto dubitaret aliquis utrum unitas sit numerus, cum non possit esse alicuius numeri radix, quia 2 est radix minima. Ideo introducit auctor partem istam (147), et stat sententia partis in hoc quod unitas non est aliquis numerus *in actu*, quia numerus est
 1535 multitudo, *sed potentialiter est unitas omnis numerus*, quia est ut materia: per replicationem enim unitatis omnis numeri quantitas efficitur.

Notandum etiam (148): subdit quaedam notabilia, et sunt tria: primum est hic, secundum (149) ibi *Inter duos cubicos*, et tertium (150) per modum correlarii ponitur ibi *Cum igitur ultra*. – Primum (148) est
 1540 quod *inter duos quadratos numeros proximos est unicum medium proportionale, quod scilicet provenit ex ductu radices unius quadrati in radicem alterius*. Verbi gratia, 4 est numerus quadratus, cuius radix est 2; 9 est alter numerus quadratus proximus, et eius radix est 3. Inter 4 et 9 est unicum medium proportionale, scilicet 6, quod provenit ex ductu binarii in
 1545 3, quia bis tria sunt 6; et vocatur medium illud "proportionale" quia, quae est proportio quadrati maioris, scilicet 9, ad illud medium, eadem est proportio eiusdem medii ad minorem quadratum: utrobique enim est proportio sexquialtera: sicut enim 9 continet 6 et eius medietatem, sic 6 continet 4 et eius medietatem. – Et nota quod illi
 1550 quadrati sunt proximi, inter quorum radices non est medium vel numerus medius: propter hoc igitur 9 et 4 sunt quadrati proximi, quia inter radicem unius et radicem alterius non est medium, scilicet inter 2 et 3. Et dicit auctor signanter quod *inter duos quadratos proximos est unicum medium proportionale*, quia, si aliqui duo sumantur quadrati
 1555 non proximi, sicut sunt 4, primus quadratus, et 49, constat quod isti non sunt quadrati proximi, quia radix primi est 2, secundi autem 7, et inter eos non est medium unum, immo plura media, scilicet 3,4,5,6; et ideo inter istos duos quadratos sunt plura media proportionalia, scilicet 42,36,30,25,20,16,12,9 et 6. Sicut enim maior quadratus, scilicet 49, continet 42 et eius sextam partem, sic 42 continet 36
 1560 et eorum sextam partem; item sicut 36 continet 30 et eorum quintam, sic 30 continent 25 et eorum quintam; adhuc, sicut 25 continent 20 et eorum quartam, sic 20 continent 16 et eorum quartam; insuper, sicut 16 continent 12 et eorum tertiam, sic 12
 1565 continent 9 et eorum tertiam; ultimo, sicut 9 continent 6 et eorum medietatem, sic 6 continent 4 et medietatem de 4, quae 4 sunt minor

relarii: CHS; corelative B; *varie abbreviant cett.* ultra: ultima ESA 1544
 binarii: 2 ES; *alia* T; *def.* A 1545 illud: id V; istud BE; *def.* A 1548 continet: -ent VCS; *def.* A 1549 6: sex EC; *def.* A continet: -ent VCS; *def.* A
 1553 signanter: CHBS; sig()nter VETA 1554 sumantur quadrati non proximi: q.n.p.s. E; q.s.n.p. C 1557 medium unum: u.m. T; unicum m. HB; m. VES; *def.* A 1562 quintam₁: partem CSTA 25 continent: 25 continet VBS

quadratus. Sic igitur apparet quod non est necesse semper inter duos quadratos tantum unum esse medium proportionale, et ideo addit auctor "proximos".

- 1570 **Inter duos cubicos** (149): ponit notabile secundum, et est quod *inter duos numeros cubicos proximos est duplex medium proportionale, scilicet maius medium et minus etc.* Verbi gratia, primus cubicus est 8, secundus proximus est 27, radix primi est 2, radix secundi 3, et ideo sunt proximi cubici, quia inter eorum radices non est medium. Inter istos
- 1575 duos cubicos est duplex medium proportionale, scilicet 18 et 12: sicut enim 27 semel continent 18 et medietatem eorum, sic 18 continent 12 et medietatem eorum, et consimiliter 12 continent 8 et medietatem eorum, ita quod omniquaque est proportio sexquialtera. Et proveniunt haec media sic, sicut dicit auctor, quod *ducendo radicem*
- 1580 *maioris cubici in quadratum minoris cubici provenit minus medium*; sic scilicet: quia radix maioris cubici erat 3 et quadratum minoris cubici erat 4, ducendo igitur 3 in 4 exeunt 12, quod est minus medium proportionale; *ducendo etiam radicem minoris cubici*, scilicet 2, *in quadratum maioris cubici*, scilicet in 9, exhibit maius medium, scilicet 18. Et ordines
- 1585 numeros istos in tali figura sicut quae sequitur:

- Et scias quod, in quacumque proportione sunt radices adinvicem,
- 1590 in eadem sunt media, ita quod, quae est proportio maioris radices ad minorem, eadem est proportio maioris cubici ad maius medium, et maioris medii ad minus, et minoris medii ad minorem cubicum. Hoc

tatem de 4: eorum med. HBEA; eorum med. de 4 ST **1567** igitur: ergo HBSTA

generaliter est verum in omnibus, et potest idem etiam ostendi in
 aliis numeris: sit minor radix 4 et maior 5; ducatur 4 in se semel, et
 1595 exhibunt 16, suum quadratum, cuius cubicus est 64; deinde ducatur
 maior radix, scilicet 5, in se semel, et exhibunt 25, suum quadratum,
 cuius cubicus est 125. Duc ergo unam radicem in aliam, et exhibunt
 20, medium proportionale inter duos quadratos numeros, scilicet
 inter 25 et 16; deinde ducatur radix minoris cubici, scilicet 4, in
 1600 quadratum maioris cubici, scilicet in 25, et exhibit maius medium
 proportionale, scilicet 100; deinde ducatur radix maioris cubici,
 scilicet 5, in quadratum minoris cubici, scilicet in 16, et exhibit minus
 medium proportionale, scilicet 80. Si ergo velis scire, in qua
 1605 proportione se habet maior quadratus ad medium suum, et maior
 cubicus ad maius medium, et cetera, videas, in qua proportione se
 habet maior radix ad minorem; et constat quod 5 se habet ad 4 in
 proportione sexquiquarta, quia 5 continent 4 et quartam partem eius;
 eodem modo se habet maior quadratus ad medium unicum propor-
 tionale, et idem medium ad minorem quadratum, scilicet 25 ad 20 et
 1610 20 ad 16, quia 25 continent 20 et quartam partem de 20, et similiter
 20 continent 16 et quartam partem de 16; consimiliter maior cubicus,
 scilicet 125, continent 100 et quartam partem eius, quae sunt 25, et
 similiter 100 continent 80 et quartam partem de 80, quae sunt 20, et
 similiter 80 continent 64 et quartam partem eius, scilicet 16. Sic ergo,
 1615 quae est proportio maioris radices ad minorem radicem, eadem est
 proportio maioris quadrati ad medium unicum, et eiusdem medii ad
 minorem quadratum; et similiter eadem est proportio maioris cubici
 ad maius medium, et maioris ad minus, et minoris ad minorem
 cubicum. Insuper, quae est proportio minoris medii proportionalis
 1620 ad medium inter quadratos, eadem est eiusdem medii inter qua-

lineas figurae varie ducunt codd.; secutus sum E **1593** idem etiam: idem E; id etiam

dratos ad maiorem radicem, et quae est proportio maioris medii ad medium inter quadratos, eadem est proportio eiusdem ad minorem radicem. Item, quae est proportio maioris medii ad maiorem quadratum, eadem est medii quadratorum ad maiorem radicem, et
 1625 quae est proportio minoris medii ad minorem quadratum, eadem est proportio medii quadratorum ad minorem radicem. Istud verum est universaliter in omnibus numeris sine dubio.

Cum igitur ultra etc. (150): ponit notabile tertium per modum correlarii, in quo facit auctor tria: primo enim dat eorum numerum,
 1630 et secundo (151) in generali ostendit, quid sit limes, et tertio (152) specialiter ostendit, quid sit unusquisque. – Dicit primo (150) quod limites non sunt nisi novem, quia *ultra summam numerorum solidorum in hac arte numeratoria non proceditur*: consequentia ista in fine partis videbitur. – Et tunc (151) cum dicit **Est enim limes**, definit limitem
 1635 in generali, dicens quod *limes est continua ordinatio numerorum contentorum terminis extremis*, terminis dico *eiusdem naturae* existentibus. Haec etiam definitio iam apparebit in fine partis:

Et tunc (152) cum dicit **Unde primus**, notificat in speciali, quis sit unusquisque eorum 9 limitum. – Dicit igitur quod *limes primus est*
 1640 *continua progressio 9 digitorum*, verbi gratia 1,2,3,4,5,6,7,8,9. – Secundus vero est continua ordinatio 9 *articulorum principalium*, qui vocantur denarii, verbi gratia 10,20,30,40,50,60,70,80,90. – Et tertius est continua ordinatio sive progressio 9 *centenariorum*, verbi gratia 100, 200,300,400,500,600,700,800,900. – Quartus est 9 *millenariorum*, verbi
 1645 gratia 1000,2000,3000,4000,5000,6000,7000,8000,9000. – Et subdit etiam (153) quod *3 limites resultant in compositis per appositionem digitorum super quemlibet istorum* scilicet trium limitum: verbi gratia, apponantur digiti omnes, qui sunt in primo limite, super denarios qui sunt in secundo, et fiet quintus limes, ut 11,12,13,14,15,16,17,18,19, vel 21,

trecenta etc.; consimiliter praeponendo centenarios ante millenarios
 1670 cum omnibus digitis, ut 1101,1102,1103 vel 2101,2102,2103, et
 consimiliter etiam praeponendo denarios cum omnibus digitis ante
 millenarios, [et similiter etiam praeponendo denarios et centenarios
 cum omnibus digitis ante millenarios,] quilibet istorum ad aliquem
 trium ultimorum limitum reducitur, ita quod, si digiti apponantur
 1675 denariis, praecedente sive centenariorum aliquo sive millenariorum,
 ad quintum reducetur, sed si digiti apponantur centenariis, millena-
 riorum quocumque praecedente, ad sextum limitem reducitur. Ita
 credo auctorem esse intellegendum. – Et tunc, quantum ad octavum
 et nonum limites, dicit auctor (154) quod *limes paenultimus et ultimus*,
 1680 id est octavus et nonus, *resultant per replicationem termini finalis ex
 receptione millenarii supra se, quocumque alio praecedente*: ex receptione,
 dico, millenarii supra se *semel per modum quadratorum aut bis per modum
 solidorum*. Auctor vult dicere quod limes octavus fit, cum supra
 millenariorum aliquem millenarius replicatur: verbi gratia, mille
 1685 millesies, duo milia millesies, tria milia millesies, quattuor milia
 millesies, et sic usque ad novem milia millesies vel millesies novem
 milia; et fit idem limes praeponendo isti replicationi quemcumque de

Adhuc primo (158) facit quod dictum est, et secundo (160) dat cautelam quandam hic observandam, cum dicit **Si autem contingat**. Prima pars cum secunda siquid scrupulosum habent, in fine videbitur, cum me transtulero ad exempla. – **Nec cessandum** (161): innuit, quid circa alios processus sit faciendum, et patet in littera, et magis patebit infra. – **Quo facto etc.** (162): dat modum rectificandi hanc operationem, et est duplex:
- 1770 per primum habetur, utrum numerus propositus fuerit quadratus, et quae sit eius radix; per secundum autem (163), utrum erratum sit in operando necne; secundus modus ponitur ibi **Si velis igitur**; et planae sunt ambae partes.

- In exemplum dictorum sit ille numerus propositus 9548198. Unde,
- 1775 quia figurae sunt in numero impari, sub ultima incipiendum est operari; et ibi inveniendus est quidam digitus, et erit 3, quem ducas in se, et productum, scilicet 9, deleas a figura sibi supraposita, et loco figurae ultimae nihil remanebit. Quo facto dupletur digitus inventus, et duplum eius, scilicet 6, ponatur sub proxima figura versus
- 1780 dextram, scilicet sub 5, et eius subduplum, scilicet 3, sub eo, scilicet sub duplo, et stabunt figurae sic $\overset{548198}{\underset{6}{3}}$. Quo facto inveniatur quidam digitus sub proxima figura, scilicet sub 4, quem ducas in duplatum etc.; et constat quod nullus digitus poterit hic inveniri, quia 6 nequaquam de 5 subtrahentur. In hoc igitur casu, sicut dixit cautela (160),
- 1785 *debet poni cifra sub cifra sub tertia figura* versus dextram inclusive, et postea *anteriorandum est duplum cum suo subduplo* per unam differentiam; et tunc in fine stabunt figurae in hunc modum $\overset{548198}{\underset{60}{30}}$. Quo facto inveniendus est quidam digitus sub proxima figura versus dextram,

omnes **1762** iuxta eorum: circa *vacat* iuxta E; eorum C; iuxta alios D; iuxta eos HB **1763** primo: <duo facit, quia primo> *add. Cu* **1764** cautelam quandam: c. C **1765** prima pars: pa. pr. VSTA **1767** cessandum: est *add. CST* **1770** propositus: ppos. V; praepos. HB; compos. S; *def. C* **1774** ille numerus propositus (pos. C): iste n.p. C; n. iste p. - scilicet sub unitate, qui ductus in duplata deleat supra duplata,
 1790 deinde ductus in se deleat supra se; et erit digitus ille 9, quo ducto in
 6 provenient 54, quae deleas, et totum tolletur supra 6; deinde
 eodem ducto in se provenient 81, quae deleas supra ipsum digitum,
 et totum etiam tolletur. – Et est etiam alius modus subtrahendi, sicut
 auctor tetigit in littera (159), scilicet ut ducatur digitus inventus, scili-
 1795 cet 9, in duplatum, scilicet in 6, et ponatur productum supra 6;
 deinde ducatur ille digitus, scilicet 9, in se, et productum, scilicet 81,
 ponatur supra eundem digitum, ita quod prima secundi producti
 stabit ante primam primi producti; ita dixit in littera, verumtamen,
 propter cifram mediam, in hoc casu ultima etiam figura secundi
 1800 producti stabit ante primam primi producti. Et stabunt figurae sic
- $$\begin{array}{r} 5481 \\ 548198 \\ 609 \\ 30 \end{array}$$
- . Deinde subtrahas singulas de singulis, et stabit residuum sic
- $$\begin{array}{r} 609 \\ 30 \end{array}^{98}$$
- . Hoc facto dupletur digitus iam inventus, scilicet 9, et duplum
 eius, scilicet 18, ponas sub proxima figura versus dextram, scilicet
 sub 9, ponendo, sicut supra dixi, digitum illius numeri compositi,
 1805 scilicet 8, sub figura illa proxima, et articuli digitum, scilicet 1, loco
 eiusdem digiti 9; et ille 9, qui iam est subduplum de 18, ponatur sub
 suo duplo, ita quod sub digito semper ponetur, scilicet sub 8; et
 stabunt figurae hoc modo $\begin{array}{r} 6018 \\ 30 \end{array}^{98}$. Deinde anteriores duplata cum
 subduplis primis, scilicet 60, quae sunt duplata, et 30, quae sunt
 1810 subdupla; et stabunt figurae sic $\begin{array}{r} 618 \\ 309 \end{array}^{98}$. Quo facto inveniatur quidam
 digitus ante omnia duplata, scilicet sub prima figura, quae est 8, qui
 ductus in omnia etc., et constat quod nullus erit; et ideo in hoc
 casu ponenda est cifra sub cifra sub prima figura, sub qua inveni-

- 1895 modum multiplicationis primo, et quidquid provenerit ponas supra
 figuras supremas; et stabunt figurae perfecta multiplicatione recte in
 hunc modum $\frac{2457}{22089429} \frac{27}{91}$. Et tunc digitum inventum duxisti cum subtri-
 plo in triplatum, et hic est primus processus. Deinde eundem
 digitum sine subtriplo ducas in productum, id est in numerum
 1900 supremo stantem, scilicet in 2457, et provenit idem numerus, quia,
 sicut supra dictum est, ex ductu numeri in unitatem vel e converso
 non crescit aliquis numerus. Duo igitur facta sunt: iam enim duxisti
 digitum inventum cum subtriplo in triplatum, et iterum eundem
 digitum sine subtriplo in productum. Subtrahas igitur singulum de
 1905 singulo, et non poteris; nullus igitur digitus erit. In hoc igitur casu,
 sicut vult auctor (176), *ponatur cifra sub cifra sub tertia figura versus*
dextram exclusive, scilicet sub 2, et anteriorentur triplum et subtripulum
versus dextram per duas differentias, et stabunt figurae isto modo
 $\frac{22089429}{270} \frac{270}{90}$. Quo facto inveniatur digitus sub prima figura, scilicet sub 9,
 1910 qui cum subtriplis etc.; et erit 9, quem cum duxeris cum subtriplis in
 triplatum, exhibunt 24543, quem productum vocat auctor (171), in
 quem ducas adhuc digitum eundem, scilicet 9; et exhibunt 220887,
 quae tollas respectu triplatorum, subtrahendo primam, scilicet 7, ab
 illa sub qua est 7; et stabunt figurae sic $\frac{220887}{22089429} \frac{2709}{90}$, facta autem
 1915 subtractione stabit residuum sic $\frac{729}{90} \frac{2709}{90}$. Deinde ducas adhuc eundem
 digitum in se cubice, et provenient 729, quo subtracto de residuo
 nihil remanebit de numero primo proposito.

Quia igitur nihil est residuum (175), *numerus primo propositus erat*
cubicus, cuius radix est digitus ultimo inventus praepositus subtriplis; et est ista

1945 suprascripto articulo versus sinistram, cifra vero vel digito supra-
 scripto vel addito figurae memoratae, totus numerus ille figurae addi
 dicitur. – Secundum est quod, cum aliquis numerus sic additur alicui
 figurae respectu figurae subscriptae, directe addi dicitur. – Tertium
 est quod, cum in multiplicatione quaelibet figura unius numeri in
 1950 quamlibet alterius duci habeat, quocumque ordine hoc fuerit, in
 idem redibit; et hoc est verum, si divisim hoc fiat. Verbi gratia, si
 multiplicare velis 98 per 64, sive duxeris 6 et 4 coniunctim in 9 et 8
 sive divisim, idem exit. Nec de alio debet intellegi dictum meum:
 error enim erit, si prius duxeris 4 in 98 quam 6, vel 64 prius in 8
 quam in 9. – Quartum est quod, supra quamcumque figuram
 1955 ponitur sive scribitur sive cuicumque additur minoris numeri figura,
 respectu illius ponitur sive scribitur ille numerus, cui supraponitur
 sive cui additur illa figura minorem significans numerum; et hoc est
 prope idem cum secundo.

Ex his, proposito numero quocumque, computa numerum figura-
 1960 rum, et incipias operari sub ultimo ternario, sive fuerit completus sive
 non, sive sub ultimo loco millenarii. Et sit numerus iste 1234567890.
 Ultima figura, scilicet 1, est in loco ternarii ultimo, quia primus
 ternarius completus est in 8, secundus inceptus in 7 completus est in
 5, et tertius inceptus in 4 completus est in 2, et ultimus inceptus est
 1965 solummodo in ultima figura, scilicet in 1; illa eadem etiam unitas est
 in ultimo loco millenarii: primus enim est 7, secundus 4, et ultimus

Algorismus
Iohannis de Sacro Bosco

§1. The *Algorismus* was most recently printed by Curtze 1897; earlier editions are listed at p.V of that work. The number of extant manuscripts has hitherto prevented critical editing of the text, nor has this been attempted for the present purpose. The text follows ms.K, aided by mss. BOX (below). Paragraphs of the text are referred to by means of numbers in parentheses.

Manuscripts:

K København, Kgl. Bibl., Ny kgl. Saml., 275^a,4^o. Vellum, 20½ × 14½, ff.85, late 13th c.

Jørgensen 1923,419-20. Eneström (1885,3)22 no.1. Zinner 1936,321. OP p.4. Further references on the calendar of K are noted below; the scribal hands have been inspected by Dr. Sten Ebbesen and myself. Cf. *Introduction* §4d.

1r-10v *Omnia quae a primaeva. . . tam in numeris quadratis quam cubicis.* p.9

The manuscript is written in one main hand, from the close of the 13th century (after 1292, as is seen from a set of 4 solar tables with values from William of St.Cloud's *Almanach*, at 73r-74v, dated 1292-5). The following recapitulates those secondary notes which have been adduced to show that the manuscript was in the possession of a Dane at the University of Paris during the 1290's (Jørgensen 1923,420). At 84v, a contemporary hand

(=A) has made a list of countries belonging to the English Nation at the University, followed by an index to the whole manuscript. The last entry in the latter is "calendarium magistri p. de dacia", referring to the calendar at 78v-84r. Within this calendar, hand A ("manu secunda sæc.xiii exeunt.", Jørgensen) has added entries adapting the calendar for use in the English Nation, and probably also the note to April 17(-18), "anno domini 1295^o o(biit) matheus crac cuius anima requiescat in pace amen": 'Krag' can be Danish. Four notes on Danish feasts are written in a lighter ink and partly in a larger hand ("manu tertia", Jørgensen): Jun.25, "translatio sancti kanuti ducis"; Jul.10, "kanuti regis"; Aug.24(-25), in margin, "translatio beati lucii pape"; Jan.7, in an erasure leaving traces of hand A, "kanuti ducis". These four notes are in the same hand, with some variation, such that the first-mentioned is hard to distinguish from hand A: thus they may be later notes by the same scribe. At Aug.19, hand A has apparently written on top of some hand not recognizable elsewhere: neither note is revealing. p.13

Another hand which is certainly different from hand A has made two notes on a Danish feast: March, top of page, "anno domini m^o cc^o nonagesimo quarto nonas marci die sancti lucii"; Mar.4, "lucii pape". Thus, except for trifles, there need have been no more than two supplementary scribes in the calendar, both of them Danes. One of them dates a note at 1294; the other one has a note for the year 1295, re-works the calendar for use in the English Nation, and makes the index including the name of Peter of Dacia.

Langebek (VI,1786,260) assumed that Peter had owned this manuscript; extracts of the calendar was printed as Peter's work by Langebek/Suhm (Langebek VI,260-5; illustration, Langebek V,1783,table facing p.38). Jørgensen (1910,255-6) disbelieved in Peter's ownership while still adhering to the attribution of the calendar, subsequently disproved by Beckman/Kålund (1914,XXXIX), who showed that the conjunction table was the common one by Grosseteste. It may, then, be tempting to revert to the assumption that the name concluding the index, and the manuscript as it was then, is indeed an owner's note; if so, this text of the *Algorism* has come into Peter's hands rather later than the composition of his *Exp. Alg.*

The *Algorism* is accompanied by some glosses, mostly in later hands. There are only two which may be contemporary, both at 1r, in a hand apparently different from the hands in the calendar (reproduction, p.9). One contains the quotations of Boëthius mainly as found in the *Exp. Alg.*, lines 29-35. The other one (cf. *Exp. Alg.*, lines 24-7) has: "Notificat causam finalem, quia finis istius scientiae est cognitio eorum quae sunt, et hoc probat auctor sic: Ars illa est necessaria, quae ducit nos in cognitionem omnium; sed haec ars est huiusmodi; ergo est necessaria. Maior est evidens; minorem probat: Unumquodque sicut est, ita cognosci habet; sed omnia sunt sub aliquo numero; si sic, ergo ars numerandi valet ad cognitionem omnium. Minorem rationis primae ponit in littera cum sua declaratione, et in hoc tangit causam finalem huius operis". The same hand, and a hand which is possibly Hand A above, have added most of the numerical examples from *Exp. Alg.*, beginning with "Exemplifices de additione per hunc modum
98706 3
12345 6" in hand A.

B Oxford, Bodleian Libr., Bodl.491. Cf. *Exp. Alg.*, *Pref.* §1.

1r-8r (Hdg.): Hic incipit Algorismus. (Txt:) Omnia quae a primaeva. . . tam in numeris quadratis quam in cubicis. (Subscr.): Explicit Algorismus compendiose compilatus.

O Oxford, Bodleian Libr., Can.Misc.161. Cf. *Calendar*, *Pref.* §2b, ms.Oc, and §4 below for the glosses.

1r-6r Omnia quae a primaeva. . . tam in numeris quadratis quam cubicis.

X Stockholm, Kgl.Bibl., X 767. Vellum, large 8^o, ff.99, early 14th c.(text-hand). Reproduction in København, Kgl.Bibl., ms.phot. 5,4^o. See §4 for the glosses.

Stephens 1847,32-4, no.XII. Jørgensen 1910,257. Beckman/Kålund 1914, XLI-XLII.

15r-23v (p.29-46 of reproduction; hdg.:) Incipit algorismus sive ars introductorius in numerum. (Txt:) Omnia quae[[cumque]] a primaeva. . . Et haec de radicum extractione dicta sufficiant. (Subscr.:) Explicit algorismus.

The manuscript has been in Danish possession from some early time. It begins with a Grosseteste-calendar (p.1-14) in a contemporary hand, containing feast-days for the diocese of Roskilde, and with secondary notes in various hands, including contemporary ones, two of which bear the dates 1303 and 1290 (Apr.7 and Jul.4; Jørgensen). The calendarial part ends abruptly with the Tabula Gerlandi at p.14, and at p.15 there is a canon to the Tabula Gerlandi (see *Calendar*, App.5(a2)) with about a page of text missing at the beginning: thus just one leaf may have disappeared, and even if the calendar may be in a hand of its own, the coherence with the rest is probably original (compare Beckman). At p.131, to a Quadrant treatise in the same hand as the Algorism, a hand of the 14th-15th century has added "Rosk(ildis) 55 graduum 12 mi(nutorum) et 16 secundo- rum" (*Intr.* §18a).

I have also seen the following manuscripts:

D Paris, Bibl.Nationale, lat.7195, 1r-6v, 14th c.

E Erfurt, Wiss. Allgemeinbibl., 4^o351,43r-45v, 13th-14th c.

G Princeton, Univ.Lib., Garrett 99, 117r-124r, early 14th c. See §4 for the glosses.

J Firenze, Bibl.Medicea-Laurenziana, plut.18 sin.6, 20r-(photo incomplete), 13th-14th c.

L Leipzig, Univ.Bibl., 1470, 433r-444v, 15th c.

N Paris, Bibl.Nationale, lat.7420A, 54r-55v, first half of 14th c.

P Salzburg, Bibl. der Erzabtei St.Peter, b IX 14, 78r-82v, 74r-77r, 15th c.

Q Erfurt, Wiss. Allgemeinbibl., 4^o369, 145r-151r, early 14th c.

R Paris, Bibl.Ste.Geneviève, 1043, 1r-5r, early 14th c.

S München, Bayerische Staatsbibl., Clm 11067, 138r-142r, 15th c.

T London, British Lib., Sloane 514, ff.2-3-5-4-7-6-8, 13th c.

I have not seen München Clm 14684, used by Curtze in addition to S (Curtze p.V).

§2. For a rough guess as to what texts are similar to that used for Peter's *Exp. Alg.*, one might consider the following variants:

(2), alternative versions (ms.T not present):

- | | |
|---|---|
| (a) Hanc igitur. . . (as <i>Exp. Alg.</i>) | : KQ,OENS, J,R |
| (b) Cum igitur. . . | : DG, X(with (a) added in mg. before (b)) |
| (a)+(b) | : PL |
| (b)+(a) | : B |

(136) or (137), "et dicitur quadratus quia. . .quadranguli" (ms.J not present):

- | | |
|--|--|
| in (136) only (as prob. <i>Exp. Alg.</i>) | : Q,B, OENS |
| in (137) only | : K,XT,R, L(with an example at (136)) |
| both | : DG (first time "quia. . .quadr."),
P (first time garbled) |

(138), the definitions (ms.J not present):

- | | |
|-----------------------------------|--|
| (a) Si autem numerus bis. . . | : DG,XT,OENS |
| (b) Numerus solidus est. . . | : R,L |
| (a)+(b) (as in <i>Exp. Alg.</i>) | : KQ,B |
| (b)+(a) | : P (preceded by "vel habes illam litteram") |

None of the manuscripts show the beginning "et ratio huius est" for (74) (cf. *Exp. Alg.*, lines 805,813-4), nor the reading "qui ductus in se quadrato modo" in (157) (*Exp. Alg.*, line 1745). Thus, if Peter used only one text and reproduced the wording with any fidelity, no version like it has been found. The best approximation seems to be Q, but since the text is bad in details I have decided not to use it. Among the next-best there are K, B, and the group OENS, among which K recommends itself for its external history. For the same reason, and to have a counter-balance to the text, I also adduce X.

§3. Thus K is used as basis for this text, and generally a reading is adopted which is either common to K and at least one of BOX, or common to all of BOX against K. In other cases K was generally preferred. The notation of numbers follows K. Chapter rubrics have been ignored. In the text, [] and () enclose passages which are not in K; the latter set denotes expansions of passages represented by "etc.", generally printed on no particular manuscript authority. Passages in [] are in K, but are considered to be individual additions or not to have been known by the *Exp. Alg.* < > enclose a passage only known to me from the *Exp. Alg.*

The apparatus notes all departures from K, readings against K in at least two of BOX, and a selection of longer variants, which turn out to be mainly from X.

§4. The marginal *glosses on the Algorism* in manuscript X (and GO), here printed below the text and apparatus of the Algorism, form part of a set which also covers Sacrobosco's *Sphaera* and *Compotus*. The other incipits are

(*Sphaera*:) Quia hic (ille X) tractatus de sphaera astronomiae subicitur, primo videndum est quid sit astronomia. . .

(*Compotus*:) Iste liber dividitur in prooemium et (tractatum sive *add.*O) executionem, ibi (*om.*X) *Tempus igitur*. In prooemio primo definit hanc scientiam. . .

The part concerning the *Sphaera* was printed by Thorndike (1949,412-44, cf.33) from G and O (=his O and B, resp.).

I print all the glosses from X which are in a uniform hand possibly contemporary with the text-hand. The only other notes in X are short and probably later, including the numerical examples from the *Exp. Alg.*, up to and including "exemplum multiplicationis in omni casu ⁴⁵⁰⁶⁰2030". X contains very few glosses which are not also in both G and O. On the other hand, each of these contains extra matter, as follows:

G has the numerical examples from the *Exp. Alg.*, up to and including division; extracts on *proba* from the same work (cf. *Exp. Alg.*, lines 689-92; 777-85; 1102-5; 1299-1323), the last and longest one with readings much resembling those of ms.E of that work. Further, G has some quite extensive notes on calculation with fractions; four smaller notes on the etymology of "algorismus", on Boëthius, on a table of cubes, and on cube roots of numbers less than 1000; and a figure of chess-board multiplication. Finally, some notes meant as corrections to the text itself, among which appear the additional passages of O at (36), of X at (87) and (103), of XB at (130), and some lesser ones. These may be the result of a collation against some text similar to X.

O, which from the details seems to be independent of XG, has revised the glosses to the first two chapters, collecting the original

glosses after the end of the treatise. Near the end there are also two versions of the glosses, in some disorder. In both cases I have disregarded the secondary versions. There are some two dozen extra glosses, none very informative, and apparently unconnected with the *Exp. Alg.* The numerical examples are not those of Peter.

For the glosses in K see §1. I have noted substantial glosses also in Q, P, and L, which do not much resemble each other or those printed here except for some shorter passages and some extracts from the *Exp. Alg.* Q in particular contains an abbreviation of Peter's section on cube roots with the example 1234567890. P also has various shorter extracts; a *terminus post* is given by its citations of Jean de Murs and Bradwardine.

The present text, then, is strictly an edition of X, with only the most necessary additions and corrections from GO. Single glosses are divided by "–" or by a paragraph boundary. The division is according to X or, in a few cases, provoked by omissions or displacements in G or O. I print the glosses in X or in both G and O, with the restrictions mentioned. Single glosses which are only in X or only in GO are marked accordingly, in some cases with [] and < >, respectively. The use of lemmas and of "ibi", "hic", "hic agit/determinat" follows X tacitly, as does the notation of numbers. The apparatus registers all departures from X, and the consensus of GO against X.

(1) In hoc prooemio tangit breviter 4 causas huius libri et necessitatem, et incipit a causa finali.

- Et nota, cum dicit *ratione numerorum etc.*, quod ratio materialiter dicitur, unde versus "Vis animae ratio discretio compotus atque Definitio causa proportio dicitur esse". Sumitur autem hic ratio pro proportione vel discretione, quia omnia discreta ac distincta sunt adinvicem secundum discretam quantitatem; vel pro proportione quia, cum omnia facta sint in numero pondere et mensura, et in his proprie proportio existat, omnia debita proportione constabunt. - (XO:) Unde Philosophus in primis 4 elementis decuplam innuit esse
- 5* proportionem, cum dicit quod ex uno pugillo terrae fiunt 10 aquae, et ita in ceteris, et hoc per rarefactionem; eodem modo per condensationem ex 10 pugillis ignis fit unus aëris, et ita in ceteris. Si ergo simplicia inter se sunt secundum proportionem, multo fortius composita, in quibus multiplex elementorum proportio multiplices differentias inducit et formas; unde, qui
- 10* numeros, id est artem numerandi, ignorat, omnia quodammodo et per consequens se ipsum ignorat.

- (3)** Quia haec ars sine numeris exerceri non potest, primo in executione sua ostendit de numero quid sit, secundo dividit ipsum, ibi *Numerorum* **(5)**. - Nota quod triplex est numerus, scilicet numerus numerans, ut anima; numerus quo
- 20* numeramus, quae est quantitas de qua tractatur in arismetica; tertius est numerus numeratus, ut res numeratae, de quo hic intendit.

(7) Articulus $\left\{ \begin{array}{l} \text{primus denariorum} \\ \text{secundus centenariorum} \\ \text{tertius millenariorum} \end{array} \right.$

- 25* **(10)** In hac secunda parte determinat de speciebus huius artis; et primo in generali eas enumerat et ordinem de eis determinandi dat; secundo in speciali, ibi *Est autem numeratio* **(12)**.

3* et nota--dicitur: nota quod ratio multa significat GO

18* quid sit--ipsum: et primo definitive, secundo agit de ipso divisive GO nota: et nota GO **20*** tractatur: agitur GO **21*** numeratae: *om.* GO intendit: -itur GO

idem supponunt, **(14)** sed a diversis rationibus imponuntur: "figura" enim dicitur quantum ad lineae protractionem; "differentia" vero, quia per illam ostenditur qualiter figura sequens differt a praecedente; "locus" dicitur ratione spatii in quo scribitur; "limes" vero dicitur, quia est via ordinata ad cuiuslibet numeri repraesentationem.

(15) Sciendum igitur quod iuxta novem limites inveniuntur novem figurae significativae novem digitos repraesentantes, quae tales sunt: **(16)** Decima vero dicitur theta vel circulus vel cifra, vel figura nihili, quoniam nihil significat; **(17)** ipsa tamen locum tenens dat aliis significare, nam sine cifra vel cifris purus non potest scribi articulus. **(18)** Cum igitur per has 9 figuras significativas, adiunctas quandoque cifrae, quandoque cifris, contingat quemlibet numerum repraesentare, non fuit necesse plures figuras inveniri significativas.

(19) Notandum igitur quod quilibet digitus una sola figura sibi appropriata habet scribi; omnis vero articulus per cifram primo positam et digitum, a quo denominatur ille articulus, habet repraesentari, quoniam quilibet articulus ab aliquo digito denominatur, ut denarius ab unitate, vigenarius a binario et ita de aliis. **(20)** Omnis vero numerus in eo quod digitus habet poni in prima differentia, omnis articulus in secunda. **(21)** Omnis quidem numerus a decem usque ad centum, ut centenarius excludatur, duabus figuris habet scribi: si sit articulus, per cifram primo positam et figuram scriptam versus sinistram, quae significat digitum a quo denominatur ille articulus; si sit numerus compositus, praescribatur digitus qui est pars illius compositi, et sinistretur articulus ut prius. Omnis numerus, qui est a centum usque ad mille, ut millenarius excludatur, per tres figuras habet scribi; omnis numerus a mille usque ad decem milia per 4, et ita deinceps. **(22)** Notandum etiam quod quaelibet figura primo loco posita significat suum digitum, secundo decies suum

rationibus: *om.* K **34** differt: differat BO **36** dicitur: *om.* OX **40** 0,9--1: 1--9,0 K **43** articulus: *ante* non potest OX igitur: ergo K significativas: *om.* OX **44** quandoque cifris: vel c. guli.] Si ducatur in alium, fit numerus superficialis et non quadratus,
 405 ut binarius ductus in ternarium constituit senarium, scilicet primum
 numerum superficialem et non quadratum; unde patet quod omnis
 numerus quadratus est superficialis, et non convertitur. **(137)** Radix
 autem numeri quadrati est ille numerus, qui ita ducitur in se, ut bis 2
 sunt 4: quaternarius igitur est primus numerus quadratus, et binarius

408 2: et *add.* K **409** binarius est (*om.* K) ei.ra.: ei.ra. est b. O; b. est r.ei. X

Totius progressionis regulae sub hac comprehenduntur maxima: Per medietatem numeri positionum multiplicentur extrema coniuncta; vel e converso, scilicet: Per medietatem extremorum coniunctorum multiplicetur numerus
 155* positionum. Et haec regula est universalis pro qualibet progressionem. Et quia regulae positae in littera non sunt penitus universales, sicut nec definitio, et haec regula est universalis, ideo haec erit progressionis universalis definitio: Progressio est numerorum secundum aequales excessus sumptorum aggregatio.

160* [(X): Cum volueris scire combinationes aliquarum rerum, accipe tot numeros pariter pares, incipiendo ab unitate, quot fuerint res, et ultimum numerum dupla, et eo duplato remove unitatem et numerum rerum, et residuum ostendet tibi propositum.]

(131) Sequitur de nona specie huius artis, scilicet de radicum extractione in
 165* numeris quadratis et cubicis; et quia ad hoc sciendum necessarium est scire quid sint, et cum de ratione magnitudinis sint, praemittitur primo capitulum, in quo agitur de numero relato ad geometricas figuras, secundo de radicum extractione, *Radice[m] numeri* (155). Adhuc primo dat intentum suum, secundo prosequitur, *Praenotanda tamen* **(132)**; et hic primo facit quod dictum est,
 170* secundo de 9 limitibus, *Cum igitur ultra* (150). Primo ponit divisionem numeri relati ad geometricas figuras; secundo membra declarat, ibi *Linearis est* **(133)**; et in hac primo de lineari, secundo de superficiali, *Numerus superficialis* (134). – **(134)** Secundo de superficiali, et primo quid sit in generali, – **(135)** secundo in speciali; et primo distinguit superficialem et solidum, secundo declarat, *Si*
 175* *igitur numerus* **(136)**; et in hac, primo de superficiali, secundo de solido, *Si autem numerus* (138). Adhuc primo, quid quadratus; secundo, quid superficia-
 lis, *Si in alium* (136); tertio dat convenientiam eorum, *Unde patet* (136); quarto reddit, super quadratum ponendo exemplum, *Radix autem* **(137)**. Et primo ponit exemplum, ut ostendat quid quadratus et quid radix; secundo reddit

171* est: *om.* GO

176* numerus: -ros X; *def.* O

410 est eius radix [; et dicitur quadratus, quia divisim scriptus per unitates
habebit quattuor latera aequalia ad modum quadranguli].^a

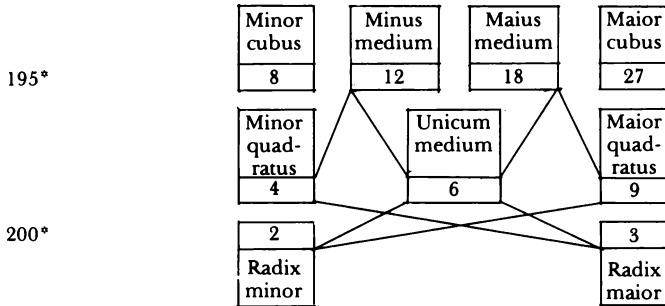

(138) Si autem numerus bis ducatur in numerum, constituit
numerum solidum. Numerus solidus est qui provenit ex duplici
ductu numeri in numerum. (139) Et dicitur solidus quoniam, sicut
415 corpus solidum 3 habet dimensiones, scilicet longitudinem, latitudi-
nem et spissitudinem, ita numerus iste 3 habet numeros producentes
se. (140) Sed numerus potest dupliciter bis duci in numerum, quia
aut in se ipsum aut in alium. (141) Si igitur numerus bis ducatur in
se ipsum vel semel in suum quadratum, quod idem valet, fit
420 numerus cubicus; (142) et dicitur cubicus ab hoc nomine 'cubus,
cubi', quod est 'solidum'. Est autem cubus corpus quoddam 6
habens superficies, 8 angulos et 12 latera. (143) Si vero aliquis
numerus bis ducatur in alium, fit numerus solidus et non cubicus, ut
bis 3 bis constituunt 12; (144) unde patet quod omnis numerus cubi-
425 cus est solidus, et non convertitur[; omnis etiam solidus est superfici-
alis, et non convertitur]. (145) Ex praedictis etiam patet quod idem
numerus est radix quadrati et cubici; non tamen illius radicis idem
[est] quadratus et cubicus. (146) Patet etiam quod omnis numerus
potest esse radix quadrati et cubici, sed non omnis numerus qua-
430 dratus vel cubicus. (147) Cum igitur ex ductu unitatis in se semel vel
bis nihil proveniat nisi unitas, dicit Boethius in Arismetica quod
unitas potentialiter est omnis numerus, nullus tamen actu.

(148) Notandum etiam quod inter quoslibet duos quadratos
proximos est unicum medium proportionale, quod provenit ex ductu
435 radicis unius quadrati in radicem alterius. (149) Inter duos cubicos
quoslibet proximos est duplex medium proportionale, scilicet minus
medium et maius. Minus medium provenit ex ductu radicis maioris

cubici in quadratum minoris; maius, si ducatur radix minoris cubici in quadratum maioris.

- 180* rationem quare dicatur quadratus, *Et dicitur quadratus (137)*. [- (137) (X:) Quarto redit, supra quadratum ponendo exemplum, ut ostendat quid quadratum et quid radix; secundo reddit rationem quare dicatur quadratus, *Et dicitur quadratus (137)*.] - (138) Secundo de numero solido. Et primo; quid sit in generali; secundo distinguit ipsum, *Sed numerus potest (140)*; tertio declarat, *Si ergo numerus (141)*. - Et nota quod omnis numerus cubicus ductus in se semel producit cubicum simul et quadratum, et e converso omnis quadratus in se ductus cubice cubicum pariter et quadratum constituit. <- (141) (G:) Declarat quid cubicus. - (143) (GO:) De solido quid sit.> - (144) Dat convenientiam et differentiam cubici et solidi. - (145) Dat triplicem convenientiam et differentiam quadrati et cubici, et primo primam; secundo secundam, *Patet etiam (146)*; tertio tertiam, *Notandum etiam (148)*. [- (148, ad textum "provenit ex ductu unius quadrati"): Et idem resultabit, si ducatur radix unius in radicem alterius].

- Sicut habetur in arismetica: quod aequalium nulla est compositio, sed inaequalium, scilicet maioris ad minorem et e converso. Sunt autem huius inaequalitatis 5 species, 3 simplices et duae compositae. Aut enim quantitas maior continet minorem pluries quam semel, et haec dicitur multiplex, cuius species sunt duplum, triplum et sic in infinitum. Aut continet ipsam semel et aliquam partem eius, et dicitur superparticularis, cuius species sunt sexquialtera, sexquitertia et sic deinceps; et dicitur sexquialtera a 'sexqui', quod est totum, et altera, quasi continens totum et alteram partem, id est medietatem. Aut continet aliam semel et aliquas partes eius, et dicitur superpartiens, cuius

188* de solido q.s.: declarat quid sit solidus numerus O; def.X

192* et idem--alterius: om.O; pauca add.G

440 **(150)** Cum igitur ultra summam numerorum solidorum in arte
 praesenti non fiat processus, tantum 9 proprie numerorum limites
 distinguuntur. **(151)** Est enim limes numerorum eiusdem naturae
 extremis contentorum terminis continua ordinatio. **(152)** Unde
 primus limes est 9 digitorum continua progressio; secundus vero 9
 445 articularum principalium; tertius centenariorum; quartus millenari-
 orum. **(153)** Tres etiam resultant in compositis per digitorum appo-
 sitionem supra quemcumque articularum trium praedictorum, et si
 alter alteri praeponatur. **(154)** Sed per finalis termini rationem ex
 millenarii receptione supra se semel per modum quadratorum aut bis
 450 per modum solidorum, quocumque alio praecedente, resultat paen-
 ultimus limes et ultimus.

(155) Radicem numeri quadrati extrahere est, proposito aliquo
 numero, radicem eius quadratam invenire, si numerus propositus
 fuerit quadratus; si vero non sit quadratus, radicem maximi quadrati
 455 sub numero proposito contenti invenire.

(156) Si velis igitur radicem alicuius numeri quadrati extrahere,
 scribe numerum illum per suas differentias, et computa numerum
 figurarum utrum sit par vel impar. Si par, incipiendum est operari sub
 paenultima; si impar, ab ultima; et ut breviter dicatur, semper ab
 460 ultima impari incipiendum est.

(157) Sub ultima igitur figura in impari loco posita inveniendus
 est quidam digitus, qui ductus in se deleat totum suprapositum sibi
 respectu sui, vel in quantum vicinius potest. Tali autem digito invento
 et a superiori subtracto, duplandus est ille digitus, et duplatum
 465 ponendum est sub proxima figura anteriori versus dextram, et eius
 subduplum sub illo. **(158)** Quo facto inveniendus est quidam digitus
 sub proxima figura ante duplatum, qui ductus in duplatum deleat
 totum suprapositum respectu duplati, deinde ductus in se deleat
 totum suprapositum respectu sui, vel in quantum vicinius potest.

§1. *Sketch of the edition.*

The *Preface*, referred to by "§", presents the manuscript evidence accessible to me (§2). A set of reference manuscripts for the *Calendar* is selected (§3-5) and used in discussing the evidence for the text edited (§6-22, including apparatuses where necessary). The rest of the manuscripts are adduced occasionally, in order to indicate the later tradition of the texts in question.

The *Text* aims to show the *Calendar* in a frame-work suitable for simulating its use and for comparison with fresh witnesses. In particular, the odd-numbered month-pages present some calendrical sub-tables which are probably all inauthentic but frequent in the manuscripts.

The *Appendices*, referred to by "App.", contain sources, testimonies, and derivatives of the texts edited, as well as specifications on some further texts frequently found in the manuscripts and only summarily registered in §2. A certain amount of cross-references to other salient items in §2 have also been included, without extensive discussion.

§2a. *List of manuscripts.*

In the datings, "1,2" denote half centuries, and "p,m,f", beginning, middle and end of a century. In the locations, "Germ." may include Austria. Suggestions for closer datings and locations can often be found in §2b.

The inventories only show a selection of commonly occurring features as specified below. Manuscript entries have been bisected in a few notable cases, to point out different hands and/or different parts of a manuscript.

Symbols used in the list:

Underscored: item carrying references (including ascriptions) to Peter of Dacia.
x: a noteworthy item which does not fall under any of the alternatives offered under the heading.

apostrophe: item abbreviated or otherwise modified.

&: conflation of two items or classes.

Single headings. See Table of Contents and §1 for names not explained below.
Cycl:

k,a1, . . .,d: class symbols according to § 4a.

Alts, Qdie, Grad, Decl:

+: values like those printed, cf. §§15-18.

!: table separate from Calendar.

Kal.canon:

A: Kal.canon A.

Ba. . .Bc: Kal.canon B, collatable with the text printed at p.334; class symbol a. . .c according to §8.

d1. . .l2: references to App.2. Thus, "d1" denotes the "Kal.canon B(d1)" of §2b.

T.L.: Right entrance column (cf. §22)

a: as printed

b: beginning with 13°

c: in degrees and minutes

d: split into several columns of degrees

+: not seen.

T.L.canon:

Aa. . .Ad: text collatable with the one printed at p.333; class symbol a. . .d according to §9.

a1. . .g: references to App.3. Thus, "a1" denotes the "T.L.canon(a1)" of §2b.

various:

a. . .d: references to App.1.

q: App.5(h1).

computus:

a,b,c1: references to App.5.

d: item(s) under any of the headings App.5(d1-3).

lunar tables:

a,b,c,e: references to App.4.

planet tables:

App.6(c), number of rows.

+: present; information insufficient.

astrology:

a,b,d1. . .d9: references to App.6.

+: other notable pieces.

other calendars etc.: whole calendars or elements of them, such as eclipse tables.

References to sections of App.5(j).

vicinity: salient items only.

liturg.(cal.): notes in calendar indicating a liturgical use.

none: manuscript apparently independent of surroundings.

blank: no definite information.

§2b. *Descriptions of manuscripts.*

See generally the section *Editorial Conventions*.

In the heading of each description it is stated what parts of the manuscript I have had access to. Supplementary information has been taken from catalogues where they were available.

Manuscripts of the 15th century or later, and those which only contain the *T.L.* and lack ascriptions to Peter of Dacia, have mostly been perfunctorily registered. Notes later than the 16th century, and texts which are not computational, astronomical or astrological, have been disregarded everywhere.

Feast-days, in the paragraphs concluding some of the descriptions, have been excerpted only in calendars containing Peter's table of conjunctions (*Cycl*), and only from the sub-table *Dfes*. They are cited in selection, in order to locate liturgically used calendars approximately. Rubricated feasts, where discernible in the reproductions, have been marked with an "R" before the date.

The inventories have only been broken into paragraphs in order to draw attention to important items.

Besides the names listed in the Table of Contents, the following notation is used in this section:

"(CALENDAR(sub-tables in their order): remarks on sub-tables)
 (:Hdgs.: Cycl,. . . Dfes,. . . Comp,. . .)
 (:Additions:. . .)"

contains the description of the 12 month-pages of the Calendar. The sub-tables are usually those described in §3 and §10-19; other sub-tables are given an ad-hoc symbol and are always remarked upon. "(Hdgs:. . .)" is a list of headings to the sub-tables in §12-14, and occasionally to others. As for the headings to *Dfes* (§13), the names "number of days", etc., mean that the numbers in question are present, but do not show how they are in fact labelled or ordered. "(Additions:. . .)", in this connexion, comprises items occurring strictly on the month-pages, other than calendrical sub-tables or headings to them; examples in §20b.

"KAL.CANON B(x)" refers to App.2, section x.

"T.L.CANON(x)" refers to App.3, section x.

"Letter table" is the *parva tabula* of Kal.canon B.

"tabular letters" denotes just the set of 35 letters "b',. . .u',;a, . . .;q". In citing incipits of tables, any dots have been ignored.

Bs Bamberg, Staatliche Bibl., R.B.msc.176. Paper, 29½ × 20½, ff.18 + 286 + 173, ca.A.D.1400. Several hands. Photographs 1r-18r.

Expliciu[n]t dicta(?) et naturae 12 signorum, completa Aquis per manus Iohannis de Restail, anno domini 1349 in die sancti Matthaei apostoli et evangelistae.

The calendar is German. It has some feasts, most of them non-local, in common with the calendar in T and occasionally with others, such as: Perpetue et Felicitatis, Mar.6; Conversio Marie Magd., Apr.1; (Dedic.) Marie ad martyres, Mai.13; Wilhelmi cf., Mai 29; Longini militis, Dec.1.

W alone has some feasts which are more specifically Southern German, namely: Helene regine, Apr.15; Timothei et Symphoriani, Aug.21; Corbiniani, Sep.8; and together with a secondary hand in M, Guidonis ab., Mai.4.

Ef Erfurt, Wissenschaftliche Allgemeinbibl., 2° 267. Vellum, ff.208, middle of 14th c. (ca.1348, Schum; perhaps ca.1340, cf.199r.) Microfilm 196v-200r.

The calendar is almost filled out with feasts, most of them non-local. Some of these show a connexion with some order, such as: Cyri et Iohannis m., Jan.31; Guilelmi cf., Feb.10; Trl.Augustini(duplex), Feb.28; Sotheris et Gaii, Apr.22. Some others seem rather to point to Southern France: Maioli abb., Mai 11; Pontiani pp.m., Nov.19; Cypriani abb., Dec.9. Cf. also Heloy(!) ep.cf., Jun.25, with Eligii ep.cf., Dec.1. I cannot identify Columbani abb., Mar.29, nor Trl.S.Christine apud Panormam, Mai 7. On the whole, even when taking into account the uncertainty produced by the richness of the martyrology and the bias of Grotefend, some connexion with France must be considered likely.

Fp Firenze, Bibl. Medicea-Laurenziana, plut.18 sin.6. Vellum, 8°, ff.96, first half of 14th c. Text-hand at 3r-(20+); additional hand 1r-2r and 94r-96v. From Franciscan convent of S.Croce, Florence (16th c. note on 2v). Microfilm 1r-22r; 84v-96v.

(:Table, 13 × 28, hdg.:) Tabula lunae ad inveniendum locum eius, videlicet in quo gradu cuius signi sit. **57v** (hand 3(?), notes on medicine. Further notes in other hands.)

58r-77ra (Sacrobosco, Computus, with corrections and glosses in hands 2 and,probably,5.) **77ra-83va** (Old Quadrant "Geometriae".) **83va-b** (a prayer, hand as on 57v.)

The calendar, although rather nondescript, seems to be Northern French; instances are Guilelmi (Bitur.), Jan.10; Juliane v., Dec.10. The rubricated Benedicti abb., R Mar.21, and Francisci cf., R Oct.4, only weakly indicate a connexion to some order.

Kt København, Kgl.Bibl., Thott 240,2°. Vellum, 45½ × 33½, ff.1+12+I, A.D.1480 or later (f.8r). Roman numbers throughout. Prints from microfilm 1r-12r (K.B.micro 220), and inspection.

Hdg.:) Tabula angeli. ¶(Rota(7) for age of moon at the five feasts, App.5(d4).) **9r** (Lunar table, 12 × 12, App.4(a), no hdg.)

9r-11v (Canons for the tables at 7r-9r, cf. generally App.4(a2):) Ad habendum generaliter cognitionem omnium tabularum quantum ad formationem. .Deinde sequitur tabula terminorum, quae terminorum dicitur quia in ipsa termini quinque festorum mobilium per ordinem inveniuntur. .Deinde sequitur tabula Dionysii, cuius longitudo continet 28 annos sive distinctiones, quoniam proceditur in tot annis quot cyclus solaris continet. .Deinde sequitur tabula contra, cuius utilitas est: si quinque festa mobilia invenire volueris, ad tabulam ex opposito correspondentem tabulae Dionysii transeas, quae contratabula dicitur. .Deinde sequitur tabula Bedae, circa quam tria principaliter sunt notanda: primum est eius formatio. .Sequitur tabula angeli, iuxta quam duo sunt notanda: primum est eius formatio. .(Hdg.:) Expositio tabulae signorum

vel medicorum. (:Txt, App.4(a2):) Sequitur tabula signorum vel medicorum, cuius utilitas est. . . **12r+** (Sacrobosco, Algorismus, with glosses; subscription at 16v, dated 1387.)

The calendar has feasts for each day, in several hands. The distinctive ones in the first hands are Central European: Sigismundi m., R Mai.2; Trl.Wenceslai, R Mar.4; Alberti ep.m., R Apr.23; Trl.Adalberti, Oct.20 (later hand?). Monastic: Anniversarium <>, R Sep.16; Anniversarium fratrum so. de praedicatorum ordine, R Oct.10. Some feasts in a secondary hand are Dominican: Trl.Thomae de Aquino, Jan.29; Katharine. de Senis (can.1461), Mai.4; Bernhardini cf. . . fratrum praed. (can. 1450), Mai.20.

Sc Leiden, Bibl. der Rijksuniv., Scal.66. Vellum, 12½-15 × 11½, ff.48; the relevant part, comprising ff.39-48, is from the first half of the 14th c. Photographs 39v-48r.

Bibl.Univ.Leid.Codd.mss.II,1910, p.26. Zinner 1925 no.2064;1936 no.8. OP 4.18. Van Wijk 1936, plate facing p.40 (reprod. of f.41r).

39r (blank) **39v** (KAL.CANON B. Hdg.): In ista parva. . . per annos domini. (:Letter table 1292-1653.) (:Hdg.): Canon supra kalendarium magistri Petri de Dacia dicti Phylomena. (:Txt:) Quære inter numeros. . . nocte precedente.

40r-45v (CALENDAR(Cycl,Naur,D,Dfes+Comp,Dmen,Dann): *Naur*, two cols. for February, one of them headed "in anno bissexti". *Comp* indented.) (:Hdgs.: Cycl, "Cycli primationum lunae". Dfes, reg.fer., reg.lun.) (:Additions: in text-hand, "nox habet horas. . . dies. . ." for some months. In other hands, marks for unlucky days, and some computistical notes: "Annus habet menses 12. . ." (Jan., 2nd hand); "Vincentii festo. . ." (Jan., possibly text-hand; App.5(f1)).)

46ra-va (KAL.CANON A. 46ra,top,2nd hand:) Primus canon Petri de Dacia pro renovatione sui calendarii. (:Txt:) In hoc primationis cyclo. . . scilicet anno 1444^o. (:Subscr. :) Explicit primus canon magistri Petri de Dacia dicti Philomena. **46va-47ra** (KAL.CANON A. Txt:) In hoc primationum cyclo. . . ab assumpta eam sequitur. (:Subscr. :) Explicit secundus canon magistri Petri de Dacia dicti Philomena supra kalendarium suum ab eo noviter compilatum.

47v (computistical notes, i.a."Regulae de die paschae. . ." for 19 years, cf.App.5(e1); verses on intervals "Sanctorum sanctus. . .", App.5(f1). Other notes in various hands which might be contemporary, among which one in French, App.5(f1):) apres la sainte ?Agate prime lune que-rons, lou samedi apres la uoile des brandons. **48r** (8 verses, not text-hand:) Cur miser ingrederis, nudo pede, veste carente. . . (:not in Walther.) ¶Janus et Augustus necnon. . . (:6 verses, App.5(f1).)

The calendar contains some feasts proper to Paris: Marcelli ep., Jul.26; Genovefe v., Nov.26. Further, e.g., Lupi ep., Jul.29; Hilarii ep.cf., Oct.25,

both of which may be French; and the English Oswaldi ep., Feb.28. I have not located the rubric *Revelatio 7 dormientium*, R Jun.27, nor *Hilarii ep.*, Jul.8. Still probably Northern France.

- L** Leipzig, Univ.Bibl., 1487. Paper, 20½ × 15, middle of 14th c. At least two hands, which may be contemporary; the distinction below is tentative. Microfilm 1r-10r.

Zinner 1925 no.2065; 1936 no.10. OP 4.19.

1r-v (computistical rotae (19 and 28); short titles only. Cf.App.5(b).)

2r (T.L., 14 × 12. Subscr., 2nd hand:) *Tabula magistri Petri de Dacia ad sciendum in quo signo et in quo gradu signi sit luna quolibet die anni, incipiendo diem a media nocte secundum ecclesiam.* (:below, 2nd hand:) *Tabula medicorum.* (:left and right entr. normal, hdgs. "Aetas lunae / (not in photo)". Upper entr. with month-names Apr-Mar.)

2v (KAL.CANON B(d1). Hdg. :) *Hii sunt quattuor cycli. . . omni anno.* (:Letter table with the years 1292-1653 above the table and 1672-2033 below.) (:Txt:) *Quaere inter numeros. . . litteras invenire.*

3r-8v (CALENDAR({Cycl,Naur,D,Dfes+Comp},{Dmen,Grad},{Qdie,Qnoc,Alts},X): the columns may be re-arranged, keeping order within the groups shown in brackets. *Comp* indented. *Dmen* appears to be missing for January. *Grad* and *Dmen* possibly in 2nd hand. *X*, columns of tabular letters for each of the moveable feasts.) (:Hdgs.: Cycl, none. Dfes, number of days, reg.sol., reg.lun., lunatio.) (:Additions in text-hand: tops of pages, verses "Principium Iani. . .", "Iani prima dies. . .", App.5(f1). Bottoms of pages, "horae noctis. . . diei. . ."; and "Quantitas crepusculi", two values, cf.§20. Additions in 2nd hand: "Nox habet ho.16 di.8 secundum Pe. Dacum" (January). "Dies egra hora xi^a secundum P.D." (Mai.25 and a few other dates). "Sol in aquario secundum Petrum Dacum" (Jan.12, and at varying dates in other months); "secundum Rupertum Lynconiensem" (at the date 15.Kal.Feb. and the corresponding dates of other months, as addition to the text-hand's "sol in aquario" etc.).)

9r (Lunar table, 12 × 12, App.4(a), with canon App.4(a4), and notes on elections App.6(d3).) ¶(Dietary verses, App.6(f):) *Escas per Ianum calidas est sumere sanum. . .* **9v** (App.6(d6):) *Nil capiti noceas. . . salubris.* ¶(Rota(30) for duration of moon-light, App.4(g), canon:) *Numerus exterior significat horas integrales, puncti partes horarum, et v puncti faciunt unam horam. . .* ¶(Quadrilateral figure on winds, temperaments, etc., cf.App.6(f); some lines of text at corners.) **10r** (List of intervals Christmas-Quadrag., for 1331-1419, cf.App.5(e2).) ¶(List of some times and longitudes, Oct.1345-Dec.1346.) ¶(Figure of climates, cf.App.5(h4).)

The calendar is Central European, possibly from Prague: Trl.Wenceslai, R Mar.4; Adalberti m.ep., Apr.24; Trl.Adalberti, Aug.25; Ludimille m.

elect., Sep.16. Also some Southern German feasts, e.g. Livini ep.m., R Nov.12; and the French Transfiguratio (translatio L) domini in monte Thabor, R Jul.27.

Et sic operandum est. .verificabis tabulam Gerlandi principalem. **4r-10r** (Balduinus de Mardochio, Compotus manualis, defective at beginning.)

10v (KAL.CANON A:) In hoc primationum cyclo. . anno domini (1444). ¶(Margin, smaller hand but possibly the same, T.L.CANON:) Ad locum lunae habendum. .epicycli lunae.

11r-16v (CALENDAR(Naur,Cycl,D,Dfes,Comp,Dmen,Dann): *Dfes* blank.) (:Hdgs.: Cycl, "Quattuor cycli naturalis compoti". *Dfes*, number of days, lunationes, reg.sol., reg.lun. Comp, "Hic renovatur littera dominicalis"(January, and such notes for some other months).) **17r+** (Sacrobosco, Algorismus.)

R London, British Libr., Royal 12.C.xvii. Vellum, 23½ × 17½, ff.218; f.1-145 are English from the early 14th c. (cat.). Microfilm 1r-9r.

Warner / Gilson 1921, II p.31-2. OP 4.22; 5.40. T&K 680.

1ra-b (KAL.CANON A:) In hoc primationum cyclo. .primationes sicut prius. **1rb** (T.L.CANON:) Ad locum etiam lunae. .epicycli lunae.

1v-7r (CALENDAR(Naur,Cycl,D,(Dmen),Dfes,Alts,Qdie,Qnoc): *Dmen* late addition, Jul-Sep only.) (:Hdgs.: Cycl, "Quattuor cycli lunares / Quattuor cycli primationum lunae". *Dfes*, number of days, lunationes, reg.sol., reg.lun.) (:Additions, not in text-hand: length of twilight(Jan.); days elapsed of the year (end of each month).)

7v-8r (Table(28,1044-1548), App.5(a). Hdg.): Tabula principalis Gerlandi, continens in se multa ecclesiae utilia. ¶(Canon, App.5(a1):) Quære inter numeros. .necessaria reperies. ¶(Table, 35 rows, App.5(a). Hdg.): Tabula secunda Gerlandi, et est contratabula primae.

8v (T.L., 14 × 12. Hdg.): Tabula Petri Daci de loco lunae inveniundo in quolibet die anni a media nocte sui incepto. (:left and right entr. normal (right entr. with some corrections), hdgs. "Aetas lunae / Gradus lunae".) **9r+** (Sacrobosco, Algorismus.)

The calendars of *R* and *B* are almost identical, cf. §13 and the martyrologies reproduced below, p.336 ff. Feasts notable in *RB* are: Dominici cf., R Aug.5; Ludovici cf., R Aug.25; Trl. Iacobi ap., Dec.30; Edmundi aep., R Nov.16. The feasts of *RB* do not definitely point to England.

The calendars of the manuscripts *RB**F* share some feasts locatable to Northern France, besides a few which are otherwise hard to find on the dates given. The following feasts are common to *RB**F*; a few of them also occur in the French mss. *Mj* *Kt*, and they are found singly in a few

manuscripts more. Fairly common French feasts are: Guilelmi Bitur., Jan.10; Anne matris Marie, R Jul.28; Oct.Dionysii, Oct.16 (erasure in B); Marcelli ep., Nov.3; Genovefe v., Nov.26. Restricted: Firmini, Jan.13; Trl.Bartholomaei, Jun.13; Amandi ep., Sep.20. Rare: Benedicti ab., Dec.3; Damasi pp., Dec.10.

A wider group of calendars with affinities to Northern France are those of *RBFPQGFpOr*. The following feasts are common to these calendars, without more than four exceptions for any calendar. Some feasts also occur in Cj, in the French Mj Ly, and in Mg, which is in any case rich in non-local feasts. Common: Audomari cf., Sep.9; Maglorii ab., Oct.24; Eadmundi aep., Nov.16. Restricted: Trl.Marie Magdalene, Mar.19; Isidori m./ep., Apr.5. Rare: Passio Iacobi, Mar.15; Alexandri cf., Mar.28; Calixti pp., Apr.15; Valerii m./ep., Apr.18; Victoris pp.(m.), Apr.20; Sulpicii cf., Jun.9; Calixti pp., Oct.15.

- A** London, College of Arms, Arundel 20. Vellum, first half of 14th c. I have seen a photostat of 6r-14v (= København, Kgl.Bibl., ms.phot.19,4^o) provided by Bjørnbo (cf. Jørgensen 1910,256 n.1). Roman numbers throughout.

Black 1829, 8^o, p.28. Jørgensen 1910,253;256 n.1. Beckman / Kålund 1914,XL. Thorndike 1934,647 n.4-5("BM Arundel 20"). OP 4.23. Cf. Eneström (1885,3)25 no.2; Bjørnbo 1912,95 n.1.

6r-11v (CALENDAR(Cycl,Naur,D,Dfes+Comp,Qdie,X): *Comp* indented, with notes on liturgy and vestment. X, "Declinatio solis in gradibus", integer degrees from Decl.) (:Hdgs.: Cycl, "Quattuor cycli primationum lunae". Dfes, number of days, reg.lun., reg.fer.) (:Additions: "nox habet horas. ., dies. .", each month.)

12r (KAL.CANON B. Hdg.): In ista parva. .per annos domini. (:Letter table, 1292-1653.) (:Hdg.): Canon supra kalendarium magistri Petri de Dacia dicti Philomena. (:Txt:) Quaere inter numeros. .nocte praecedente.

12r-v (T.L.CANON. Hdg.): Canon supra tabulam magistri Petri de Dacia dicti Philomena. (:Txt:) Ad locum etiam lunae habendum. .die incepta.

12v (Hdg.): Utilitates istarum trium rotarum. (:Txt, cf. App.5(b):) Si vis scire utilitates. .festa mobilia celebrabuntur. ¶(Subscription with dating to A.D.1316. **13r** (two inscribed rotae (28 and 19), cf.App.5(b), starting 1324, or "(1314)" in the latter rota. Inscription of the former:) Ad inveniendum litteram dominicalem et litteram bissexilem per annos domini.

13v (T.L., 14 × 12. Hdg.): Tabula magistri Petri de Dacia ad sciendum in quo signo sit luna et in quo gradu illius signi (:left and right entr. normal, hdgs. "Aetas lunae / Gradus lunae".) **14r** (Planet table, 24

rows, App.6(c). Hdg.:) Tabula ad sciendum quis planetarum regnat in qualibet hora diei et noctis. ¶(:Subscr.):) Jupiter et Venus. . .cum malis malus. **14v** (sign-man, with canon App.6(d7), hdg.:) Dominium signorum. (:Txt:): Duodecim sunt signa. . .Mercurius. Septentrionalis.

The calendar is English. It contains the feasts noted under C and Ca above, except Mar.24, plus many more English feasts, such as Dunstani (Ord., Oct.21; Octav., Oct.26(!); Octav., Mai.25); Elphegi (Passio, Apr.19; Trl., Jun.8; Octav., Jun.15; Ord., Nov.16); Augustini (Octav., Jun.1; Trl., Sep.13). Some feasts seem to point to London or Salisbury: Anstroberte v., Feb.10; Trl.Ricardi ep., Jun.16; Oct.Benedicti, Jul.18; Audoeni ep.cf., Aug.25; Trl.Hugonis cf., Oct.5.

- Ly** Lyon, Bibl. de la Ville, 1649 ("No.1627", cover). Vellum, each leaf folded into 2 × 3; 8 × 6 (folded leaves), 15 × 17 (unfolded); ff.14, mid-14th c. Leaf 1 fragmentary. Text generally on inner (=verso) pages; month-names for Calendar, and other titles, on outer pages. Microfilm of whole ms.

(:Additions: "nox habet horas. . ., dies vero. . .", each month. Etymological notes on each month, somewhat resembling Beda, P.L. 90,347-52, and further mentioning Isidore.)

295v (T.L., 14 × 12. Hdg.): Tabula Petri Daci de loco lunae inveniendi in quolibet die an<ni a> media nocte sui incepto. (:Left and right entr. normal; their hdgs., "Dies perfecti aetatis lunae / Gradus in quo est luna", are below the table alongside with a row of month-names Mar-Feb.)

296ra-b (KAL.CANON A:) In hoc primationum cyclo. . . anno domini 1444. **296rb** (App.1(a1):) Nota quod per hoc. . . meridionalibus subtrahenda. ¶ (T.L.CANON:) Ad locum etiam lunae habendum. . . epicycli lunae.

296va-297vb (App.6(d1):) Qui cursum lunae recte scire desiderat. . .

(:ending abruptly at bottom of page.) **298r+** (Galenus (Cat.), in another hand.)

The calendar contains one or more feasts at each day. Judging from the rubricated feasts only, it may be located to *Augsburg* itself: cf. Afre m., R Aug.7; Narcissi ep.m., R Oct.29. Some order may be indicated by Petri m., R Apr.29; Dominici cf., R Aug.5.

M8 München, Bayerische Staatsbibl., Clm 5538. Vellum, 20½ × 15, ff.75; end of 13th c.(text-hand); c.1330(? , 2nd hand); one or two further hands, numbering not chronological. From monastery at Diessen (Cat.); in the late 13th c., in Cistercian convent at Günterstal near Freiburg i.B. (Bischoff). Microfilm 54v-57r.

Cat.codd.mss.bibl.reg.Mon. III,III p.21. Bischoff, Hist.Jahrb.d.Görresges. 60(1940)567 n.93 (= Mittelalterliche Studien II,1967,212 n.85). T&K 602,1098.

-54v (Cisiojanus and tables of Gerland and Fungo (Cat.; cf.App.5(a;d2)). At 54v, a table, 19 × 7, starting with the date 7.Id.Apr., cf.App.5(d6). Hdg.): Magna Bedae tabula ad habendum diem paschalem et aetatem lunae et litteram tabularem.

55r (top, 2nd hand:) Tabula magistri Petri de Dacia dicti Phylomena. *p.14* (Lunar table, 12 × 12, App.4(a), all in text-hand. Hdg.): Haec est tabula lunae ad inveniendum in quo signo sit luna secundum veram eius primationem. (:to the left and right, the entrances from the T.L. have been added by ?2nd hand, and unsuccessfully, since they are too tall for the table. In fact, at the bottom of the page the 2nd hand has remarked:) Vidi tabulam habentem 14 interstitia in descensu vel in longum. ¶(:just below table, 2nd or 3rd hand, an incomplete canon?:) Intra per hunc sequentem numerum s<. .> vacat. **55r** (Canon to 12 × 12 table, 2nd hand?, App.4(a1):) Haec tabula docet in quo signo. . . (The mis-attribution of the lunar table was adopted by T&K 602.)

55v (Table, 19 × 5, starting with the date Kal.Feb.; App.5(d1). Hdg.): Tabula terminorum, et est prima. ¶(:Canon:) Haec tabula prima dicitur tabula terminorum, quoniam in illa termini 5 festorum mobilium per ordinem inveniuntur. . .deberet 7 diebus. **56ra** (Verses on intervals Christmas-Invocavit, for the years 1260+, cf. Bischoff; erroneously attributed to Peter in T&K 141 and Walther no.1492. App.5(f1). 4th hand:) Armatura gravis exultabunda dolenti. . .

56rb (2nd hand, T.L.CANON. Hdg.): Canon super tabulam magistri Petri de Dacia praepositam. (:Txt:) Ad locum lunae habendum. . .die incepta. ¶(Hdg.,?3rd hand:) Canon super miracula Christi scripta in spatiis sequentis kalendarii. . .

56v (top, 2nd hand, age of Christ at some Biblical events.) ¶(Hdg., 2nd hand:) Canon super kalendarium 4or cyclorum naturalis compoti.

(:Txt, text-hand, App.1(d):) Ad habendum notitiam. . .semper propositum. . .variatur in Septembri. (:Subscr., 2nd hand:) Explicit canon Lincolniensis episcopi super 4 cyclos kalendarii sui. ¶(Margin, 2nd hand:) Canon super kalendarium Thebit seu Reginae, scilicet duorum cyclorum praecedentium 4or cyclos compoti naturalis. (:Txt, 2nd hand, paraphrase of William of St.Cloud, Harper p.96ff., App.5(j2):) Sciendum quod in kalendario Thebit seu in parte prima eiusdem est una columna quae continet litteras designantes cyclum 19^{lem}. . .plantantibus et navigantibus.

57r+ (Calendar of Grosseteste, with many additions on feast-days, and notes by 2nd hand on the years 1323 and 1336. Other additions by 2nd hand (cf.App.5(j1)) are: to the left of the calendar, the two columns of William of St.Cloud's Kalendarium reginae (App.5(j2)); and to the right, the tables Qdie and Qnoc, presumably also from William.)

Black 1845, col.154-60. T&K 891.

1+ (John Launde, de temporum electione pro morbo curando; *Tabula Dionysii* (Cat.)) **7r** (Txt, T&K 1448, Decl.abbatis S.Albani super Kal. reginae:) *Si fiat quaestio de nativitate viri. . . ac multas divitias.* ¶(App. 6(b)§14:) *Multum prodest scire in quo signo. . . notabilibus.*

7r-v (T.L.CANON(c1):) *Si quis invenire voluerit in quo signo. . . addat, et habebit intentum.* (:Continuing as hdg. of lunar table:) *In pede huius tabulae habetur de partibus corporis hominis quod signum quam partem recipit, id est Aries regit caput, Taurus habet regere collum etc.* **7v** (:lunar table, miswritten and without the melothesy mentioned.)

7v-8v (App.6(b)§15-27 and an abbr. of §28:) *Quando luna est in ariete, bonum est loqui cum potentatibus. . . vel stellae fixae impediatur.* **9r-v** (App.6(b)§2-9. Hdg. :) *Proprietates planetarum et tabula eorundem.* (:Txt:) *Septem sunt planetae, scilicet Saturnus. . . 13 gradus et 10 minuta perc^{urrit}.* (:no table.) **9v** (note:) *Attractivae, triplicitas ignea: aries leo sagittarius. . .* ¶(note on planets and humors.) **9v-10r** (astrology, hdg. :) *Dignitates planetarum.* (Txt, T&K 1540, only from here (App. 6(d10):) *Sunt autem in signis quaedam fortitudines. . .*

-52r (figure of climates, cf.App.5(h4); notes on dignities of planets, in Latin and English, subscribed "secundum magistrum".) **52v** (upper mg. :) *secundum magistrum.* (:various classifications of signs, cf.App. 6(d10), citing Albumasar, de revolutionibus annorum mundi. Then notes on planets, conjunctions and lunar signs, and their influence on weather. Last note:) *Nota quod quandocumque luna est in signo frigido et humido. . . sequitur pluviam si deus voluerit. Haec est regula generalis a magistro docta.*

53r (App.6(b)§14:) *Multum prodest scire in quo signo. .notabilibus.* ¶(App.6(b)§28:) *Et nota quod quando luna est in signis terreis. .immediatur.* ¶(T.L.CANON(a2):) *Cum scire volueris locum lunae omni die per tabulam signorum. .et non diei sequentis.* ¶(Lunar table, 13 × 13, no hdg. Left entr. normal, no hdg. Right entr. meant to contain degrees and minutes starting with 13°;10, but miswritten and unfinished, hdg. "Gr.Mi.". Note to table:) *Require hanc tabulam in paenultimo quaterno huius libri proximo post coniunctiones lunae [l. .].* **53v** (Use of lunar instrument at back of New Quadrant, App.5(h3):) *Nunc iterum restat dicere qualiter pervenimus ad cognitionem lunae cum fuerit in ariete vel tauro vel in aliis signis. Scito quod super hanc cognitionem composui quoddam instrumentum et ipsum in dorso quadrantis signavi, et vocatur instrumentum lunae, cum quo sic debes operari: pone linguam solis. .Nota tamen quod ad hoc ut habeas veritatem cum isto instrumento, oportet te addere super primationem inventam in calendario 3 dies et post operari per totam summam. Dies enim incipit in meridie praecedente et terminatur in medio sui secundum astrologos.* (:Unfinished figure, with a reference to the back cover of the ms.) **54r+** (figure of a quadrant; then Tables of Will.Reed, etc. (Cat.))

Oa Oxford, Bodleian Libr., Ashmole 360. Quarto, ff.161, containing several mss., of which the pertinent one is ff.151-161, vellum, early part of 14th c.(Cat.), after 1322(f.151r), possibly the 1330's (f.158r), "by the hand of a Roman notary"(Cat.). Some notes in later hands have been ignored. Photographs 150v-158v. Very faint in parts.

Black 1845, col.271-6. Zinner 1936, no.45. OP 4.36.

151r (a canon for finding calendar letters. Faint in photo. Phrasing not unlike Kal.canon A:) *Si per istud kalendarium innovationem lunae invenire volueris, annos Christi cum «anno» imperfecto per 76 divide, et si residuum fuerit 19 vel minor(!). .Nota etiam quod 1292 divisi(s) per 76 nihil remanet: ab annis «ergo» Christi subtrahe 1292 et cum residuo operare ut supra est dictum. Item nota quod littera tabularis sive innovationis lunae renovatur in Ianuario, et quod dies et horae incipiunt ab ortu solis(!). Et in praesenti anno domini 1322, facta praedicta divisione, remanent 30^a; abiectis 19 remanent 11; ergo 11^a littera alphabeti, scilicet L, erit littera innovationis lunae.* ¶(bottom of page, note in 2nd hand:) *Ego veni de Avinione prima vice anno domini 1327^o, in secunda vice anno domini (?)1330.*

151r-v (KAL.CANON B(f2):) (Letter table 1292-1653.) (:Txt:) *Quaere inter numeros. .et fuit iste kalendarius factus anno domini 1292, et iste numerus ponitur in principio primi cycli. .nocte praecedenti.* **151v**

(T.L.CANON:) Ad locum etiam lunae inveniendum. . .epicycli lunae. ¶(Canon to Tabula Gerlandi, re-statement of App.5(a1):) Quaere inter numeros. . .inter omnia festa mobilia.

152r (T.L., 14 × 12. Hdg.): Tabula ad sciendum omni die in quo «signo et in quo» gradu signi (:sequel lost. Outer left entr. normal, hdg. "Numerus dierum aetatis lunae". Inner left entr., also in text-hand, hdg. "Alius numerus", with numbers from the 12 × 12 lunar table, App.4(a). Inner right entr. normal; hdg., partly lost, "Numerus graduum". Outer right entr. secondary, starting like the normal one but ending in degree-values which are 5° less. Upper entr. with month-names Mar-Feb.) ¶ (T.L.CANON(e):) Si per hanc tabulam locum lunae invenire volueris. . . cum enim luna innovatur, oportet esse in eodem signo et gradu signi cum sole (:by same author as the canon at 151r?)

152v-158r (CALENDAR(Cycl,Naur,D,Dfes+Comp,A,H,Decl,Grad): *Cycl*, hour numbers 1 greater than standard. *Comp* indented. *Dfes+Comp*, separate column added, containing liturgical notes. *A*, "Altitudo solis in meridie", values 28°;57-76;3; *H*, "numerus horarum diei", 9h;23-14h;37: both *A* and *H* for a latitude ca.37½°) (:Hdgs: *Cycl*, "Quattuor cycli primationis lunae". *Dfes*, month-verse "Alterius mensis. . ." (Feb.+; App. 5(f1)), number of days, lunatio, reg.sol., reg.lun., "nox habet horas. . , dies vero. .") (:Additions: Text-hand, bottom of *Dfes*, verses "Nona parit bellum. . .", App.5(f1). Uncertain hand, "Quantitas crepusculi", two values for each month, cf. §20. Later hands, copious, including: (153r a moon-book, cf.App.6(d10), "Cum luna fuerit in ariete, bonum est operari quidquid cum igne fit, aurum cambire, lapides pretiosos emere et vendere species aromaticas. . ."; (155v-156r) observations of eclipses and comets, dated 1339 and 1337, and notes on some war-time operations involving England; (156v+) App.6(d1a) and a note on unlucky days.)

158r (hand 2?: two rotae (28 and 19), starting 1330, with canons. Cf.App.5(b). First canon:) Haec rota docet invenire litteram dominicalem et litteram bissextilem, et per annos domini, capiendo ut est ostensum et perficiendo in d()o. **158v-159r** (Table(28,1044-1548), App.5(a), hdg.:) Tabula principalis Gerlandi continens multa utilia. ¶(:Canon, cf.App. 5(a), short:) Si per tabulam Gerlandi quae principalis dicitur litteram tabularem invenire volueris, quaere in superiori parte tabulae. . .omnia tibi festa mobilia perfecte monstrabit. ¶(Contratabula Gerlandi (Cat.)) **160+** (from Catalogue; all in Hand 2: Dominium signorum "Duodecim sunt signa", App.6(d7); rota for sun's entrance into zodiacal signs; Rasis, de fugandis serpentibus, and medical notes, etc.)

Of the feasts noted in the text-hand, a few shared by N (*q.v.*), and sparsely by some others, point to Italy or to some order. The same is true for the following, which may be Italian or monastic, and if so, mostly Benedictine: Basili cf., Jan.1; Severini ep.cf., Jan.8; Scholastice v., R Feb.10; Fusce et Maure vv.mm., Feb.13; Benedicti ab., R Mar.21+

Octav.Benedicti ab., Mar.28; Bernardi ab.cf., R Aug.20; Germani Capuani ep., Oct.30. The following may also be Italian: Paule nec v. nec m., Jan.26; Barbati ep.m., Feb.19; Herculani ep.m., Mar.1; Domnii aep.m., Mai.7.

The feasts noted in secondary hands (none of which appear to be the same as Hand 2 above) are mainly from *Bayeux*, such as: Renoberti ep.cf., Mai.16; Trl.Timothei, Mai.9; Exuperii. .Vigoris, Jul.14; Trl.Renoberti, Sep.3; Vigoris ep.cf., Nov.3. Northern French also Macutii, Jul.11/12.

Black 1845, col.1425-30 (listed in Summ.Cat.6750). Eneström(1885,3)22 no.4. Zinner 1936 no.19("Bodl.6750"). Jørgensen 1933, 194 n.6. Thorndike 1934,674 n.4-5. OP 4.37. T&K 680.

-8r (Alexander de Villadei "Haec algorismus ars praesens"(Cat.)) **8v** (cursive notes on paschal limits, cf.App.5(e1).)

9ra-b (KAL.CANON A:) In hoc primationum cyclo. .primationes sicut prius. **9rb** (T.L.CANON:) Ad locum etiam lunae. .epicycli lunae.

9v-15r (CALENDAR(Naur,Cycl,D,Dfes,Grad,Decl.)) (:Hdgs.: Cycl, "Quattuor cycli primationum lunae / Q.c.lunares / Q.c.naturalis compositi". Dfes, number of days, lunationes, reg.sol., reg.lun.) (:Additions, later hands: journey London-Dover-Calais-Nieuport-Bruges 1361(July 7); peace treatise England-France 1375, at Bruges (Dec.29).)

15v-16r (Table(28,1044-1548), App.5(a). Hdg.): Tabula principalis Gerlandi, continens in se multa utilia ecclesiae. ¶(Table, 35 rows, App.5(a). Hdg.): Tabula secunda Gerlandi, et est contratabula primae. ¶(15v, bottom, canon to Tab.Gerl., App.5(a1): Quaere inter numeros. . . necessaria reperies.

16v (T.L., 14 × 12. Hdg.): Tabula Petri Daci de loco lunae inveniundo in quolibet die anni a media nocte sui incepto. (:left and right entr. normal, hdgs. "Aetas lunae / Gradus lunae". To the outer left, a secondary column starting 13°;11.) **17r+** (Sacrobosco, Algorismus.)

The feasts in the calendar are almost the same as those of ms.R above; see the notes to the latter for details. Oct.15 and Oct.16 show erasures only. The calendars are connected with Northern France.

04 Oxford, Bodleian Libr., Bodl.464. Vellum, 28 × 19½, ff.3+209, A.D.1318. Earlier in St.Augustine, Canterbury (no.1156). English writing. Photographs 57v-75r.

Summary Cat. 2458. Eneström(1885,3)23 no.8. Zinner 1936 no.25 ("Bodl.2458"). OP 4.38;5.51.

-57v (Almanach of Profatius (Cat.), ending in a table of proportions.)

57b (figure for graphical determination of solar altitudes etc., at a

latitude of *ca.* 51°. App.5(h3.) **58r-59r** (canon to the calendar at 59v+. Hdg.): Canon super sequens kalendarium ad veram coniunctionem solis et lunae accipiendam, compositum a fratre Rogero Bacoun. (:Ttxt:) Kalendarium sequens extractum est a tabulis Tholetanis anno domini 1292, factum ad meridiem civitatis Tholeti quae in Hispania sita est, cuius meridianus non multum distat a meridiano medii puncti Hiberniae. . .In fine ponitur altitudo solis in gradibus ab oriente(!) in meridie, et hoc secundum latitudinem 53 graduum. . .Dicta vero latitudo efficitur civitatis Lincolnensis.

59r (Hdg.): Canon super tabulam sequentem. (:Ttxt, like KAL.CANON B:) In ista parva tabula. . .per annos domini. Quare inter numeros. . . Quocumque igitur numero. . .ipsius coniunctionis ostendit. (:Letter table 1292-1653, with the numbers "2. . .,19,1" substituted for the letters A-T.) (:This text is adapted to the calendar at 59v+, and thus with "numerus; coniunctionis" at the place of "littera; primationis". This entails the inconcinnities "coniunctionis <solis et> lunae" (l.16) and "quaeras eam (sc."numero)")" (l.30), a fact which serves to confirm the dependence on Kal.Canon B.)

59v-71r (a calendar, App.5(j3), 4 cycles of conjunctions, first value 19 1^h;2 for Jan.1.)

71v-72r (Table with 28 rows,(1215-1728,19), giving tabular letters out of a set consisting of "A-K(colour), A-N(black), A-M (with points)". Cf. App.5(c2).) ¶(Verses on solar and lunar cycle, App.5(f1):) Ter denos duo dant. . . ¶(Table, 35 rows, entrance with the tabular letters mentioned; giving dates of the moveable feasts, and Sunday letters.)

72v (T.L.CANON. Hdg.): Canon supra tabulam magistri Petri de Dacia dicti Philomena. (:Ttxt:) Ad locum etiam lunae. . .die incepta. ¶(Short notes on qualities of planets and signs.) **73r** (T.L., 14 × 12. Hdg.): Tabula magistri Petri de Dacia ad sciendum in quo signo sit luna et in quo gradu illius signi. (:left and right entr. normal, hdgs. "Aetas lunae / Gradus lunae".) **73v** (Planet table, 24 rows, App.6(c). Hdg.): Tabula ad sciendum quis planeta dominetur omni horae cuiuslibet diei. **74r+** (Figures and notes on planetary aspects, houses, etc.)

- 05** Oxford, Bodleian Libr., Bodl.551. Vellum, 24 × 16½, ff.4+238, early 15th c., written in France (Cat.) Photographs 233v-237r.

Summary Cat. 2303. Eneström(1885,3)24 no.11. Zinner 1936 no.24 ("Bodl.2303"). OP 5.52.

-233 (Lives of saints etc., connected with Auxerre (Cat.)) **233v** (Astrological notes, not in text-hand, including:) Quattuor sunt partes principales firmamenti. . .Quattuor sunt partes temporis vel anni. . .Quattuor sunt complexiones hominis, scilicet colericus (:cf.App.6(f)). . .Duodecim sunt signa supercaelestia, quorum primum est aries qui caput hominis eo quod in prima mundi constitutione coepit vergi habere dicitur. . (:last

one mainly as App.6(d7) but with signs re-ordered.) **234r-v** (Astrology, starting as App.6(d7), with extensions on properties of signs. Hdg.:) De dominio signorum et naturis eorum. (:Ttxt:) Duodecim sunt signa, scilicet aries. . . numero impari naturali ordine disposita. **234v-235r** (Astrology, cf.App.6(d10), hdg.:) De natura planetarum et eorum aspectibus. (:Ttxt:) Sciendum est quod sunt septem planetae, scilicet Saturnus. . . luna. Unde sciendum quod istae stellae dicuntur planetae quia erraticae respectu stellarum fixarum. . . si detur medicina de facili evomitur. **235v** (Computistical rules: "Adam degebat" (App.5(f1)), etc.) **235v** (App.5(h1). Hdg.:) Ad sciendum horas diei per quadrantem. (:Ttxt:) Si volueris scire horas diei per quadrantem. . . secunda et sic de aliis.

236r (T.L., 14 × 12. Subscr.:) Tabula magistri Petri de Dacia ad sciendum in quo signo sit luna et in quo gradu illius signi. (:left entr. normal, hdg. "Aetas lunae"; right entr. normal but shifted one row down and lacking last figure, hdg. "Gradus lunae". Upper entr. with month-names Apr-Mar.) **236v** (Planet table, 12 rows, 12^h, App.6(c). Hdg.:) Tabula ad sciendum quis planetarum regnat in qualibet hora diei. ¶(Note, another hand:) Jupiter et Venus sunt boni. . . **237-8** (lists of persons (Cat.), in a cursive hand.)

Oc Oxford, Bodleian Libr., Can.Misc.161. Vellum, 18½ × 13, ff.44, first half of 14th c. (13th c., Cat.). Microfilm of whole ms.

Quarto Cat.III (Coxe 1854) 533-4. Eneström(1885,3)22 no.2; 23 no.9. Jørgensen 1910, 254 n.2. Zinner 1936 no.20. OP 5.49.

-38r (Sacrobosco, Computus.)

38v-44r (CALENDAR(GG,Naur,Cycl,D,Dfes,Comp,Qdie,Qnoc,Alts,Decl,Grad,Dmen,Dann): GG, letters and numbers of William of St. Cloud's *Kalendarium Reginae*, App.5(j2).) (:Hdgs.: Cycl, "Cyclus primationis lunae". Dfes, number of days, lunationes, reg.sol., reg.lun.) (:Additions, each month, verses (cf.App.5(f1)): "Prima dies Iani", "Principium Iani", "Escas per Ianum" (App.6(f), 2nd hand), "Poto, ligna cremo . . ."; two values for "Quantitas crepusculi" (§20); syllables "Armis. . ."; Cisioganus, with expansions. Occasionally, "Hic incipiunt regulares lunares. . ." and other computistical notes.)

44v (T.L., 14 × 12. Hdg.:) Tabula Petri Daci de loco lunae inveniundo in quolibet die anni a media nocte sui incepto. (:left and right entrances normal, hdgs. "Dies perfecti aetatis lunae / Gradus signi in quo est luna". Upper entr. with month-names Mar-Feb.) **45r** (blank, end of ms.)

The feasts of the Calendar which are written in the text-hand, vaguely point to Southern Germany and possibly to some order. Examples: Paulini ep., Jun.22; Margarete v.m., Jul.15 (secondarily moved to the usual date Jul.13); Adriani m., Sep.8; Primini (=Pirm.) ep., Nov.3; Romani cf., Nov.18. Another hand has Petri m. de ordine praed., Apr.29,

peculiar to the Dominicans. One or two Humanist hands have added feasts peculiar to Italy or an order.

Om Oxford, Bodleian Libr., Can.Misc.248. Vellum, 36 × 23½, ff.45, 14th c.(from f.42 on). Some text in common with ms.A, but no calendar or canons. Photographs 39v-45v.

(:T&K 555; v.Wijk p.114.) **10v** (figure of aspects, cf.App.6(d10).) **11r+** (Mesehallah, practica astrolabii.)

Ow Oxford, Bodleian Libr., Wood D.8. Paper, 22½ × 15½, ff.5+266, written ca. 1485 at Writtle in Essex (Cat.). Contains, *i.a.*, the tables of Will. Reed (Cat.). Photographs 152r-153r.

Summary Cat.8538. OP 5.54.

-152r (table of solar longitude, day by day, ending Cap 18°;58 for Dec.31. The cat. yields no sensible context.)

152v-153ra (T.L., 14 × 12, much like that of ms. Le. Hdg.): Tabula lunae ad sciendum omni die eius signum et in quo signo est. (:upper entr. "signa septentrionalia / signa meridionalia". Left entr. normal, hdg. "Aetas lunae". Right entr. on 153ra, consisting of 12 cols.: the first one repeats the left entr. with its hdg.; the second one has the values "13,26, . . .,5"; and the 10 following cols. each augment the preceding one by 3° *modulo* 30°. These last 11 cols. have the sub-hdg. "Gradus", and all 12 cols. bear the hdg.): Tabula ad sciendum gradus lunae omni die anno. **153rb** (T.L.CANON(a2):) Cum volueris scire locum lunae omni die per tabulam signorum, videas. . . diei praecedentis etc.

P3 Paris, Bibl.Mazarine, 3599(482). Vellum, 43½ × 29, ff.1+118+1, 13th-14th c. From St.Martin at Louvain. Photocopies 95v-96v, and inspection.

Molinier III, 1890, p.139.

95v-96r (in text-hand: end of the *Chirurgia Albucasis* (transl. of Gerard of Cremona), then some arithmetic and astrology, including a piece on melothesy, a moon-book in the form of a rota, and a 12 × 12 lunar table. A *secondary hand* has glossed the piece on melothesy, and added what is listed below.)

96r (T.L.CANON(d1). Letters hidden because of the tight binding are in <>. Hdg.): <Tab>ula magistri Petri de Dacia dicti Phylomena <ad sci>endum in quo gradu signi sit luna omni die (ve)l <>die sui incepto vel in quo gradu illius signi. (:Txt:) Cum autem volueris uti tabula magistri Petri de Dacia. .<> Christi fideles semper a media nocte incipitur. ¶(T.L.CANON. Hdg.): Canon supra tabulam ma<gistri> Petri de Dacia ad sciendum in quo gradu signi sit luna omni die vel a medio <> incepto, et in quo gradu illius signi. (:Txt:) Ad locum etiam. .epicycli lunae. ¶(T.L., 14 × 12. Hdg.): Tabula magistri Petri de Dacia dicti Phylomena ad sciendum in quo signo sit luna et in quo gradu illius signi. (:left and right entr. normal, hdgs. "Aetas lunae / Gradus lunae, aliter(?) gradus signorum".)

96r (Moon-book, App.6(d9):) Martius. Cum quidem luna fuerit in ariete, bonum est versus occidentem tendere, et bonum est scribere, texere, per mare navigare. . . **96v** (App.6(d1), possibly by the same secondary hand:) Qui cursum lunae recte scire desiderat. . .

Pc Paris, Bibl.Nationale, lat.7286 C. Vellum, 30 × 22, ff.58, 14th c. Earlier at Abbey of St.Denis (Delisle, Cab.mss.I,1868,p.202,204). One hand throughout. Microfilm of whole ms.

(:left and right entr. normal, no hdgs. except the "gradus" moved into the hdg. of the table. Upper entr. with month-names Mar-Feb.) ¶(T.L.CANON(d1):) Cum volueris uti ista tabula, scies gradum . . . secundum Christicolae a media nocte semper incipit. ¶(:continuing,

cf. App.6(c):) Versus de complexionem signorum, Ignea sunt A Le Sa. . Jupiter atque Venus bene(!) sunt. . Frigidus et siccus Satur. . .(last set with glosses.)

70ra-va (Astrology, App.6(d5):) Frater Vincentius. . Quattuor sunt triplacitates. . Notandum igitur quod signorum quaedam sunt ignea. . Notandum quod aries habet caput et facies. . Unde luna existente in ariete nullatenus capiti est medendum aut radendum, nec auribus nec oculis nec ulli parti capitis est medicina danda. Tamen de brachio minui. .

70va (T.L.CANON(d4):) Respice coniunctionem solis et lunae. . nunc fuit in eodem signo. **70vb** (Two lists of eclipses, 1324-1341 and 1330-1344. Cf.App.5(j10). Canon:) Ibi sunt eclipses ad aliquod tempus, unde nota quod ubi ponitur coniunctio, intellegitur esse eclipsis solis. . incipitur in meridie et sic accipitur hic. **71r** (Table of "horae artificiales", etc., apparently auxiliary to the calendar at 57v+, App.5(j3). Hdg.:) Incipit correctio kalendarii facti a fratre R^o. Bancali ordinis minorum, et hoc est canon primi kalendarii magistri Bancalis, ut patet in illa tabula et in scripto sequenti. . (:Text of canon, T&K 745:) Innovationes seu coniunctiones lunae cum sole. . **71rb-va** (Txt, cf.App.5(h3):) Ad habendum horas diei in instrumento isocheles vocato. . **71v** (Rota(30+2), with duration of moon-light and predictions "qui hic natus erit, vitalis erit et pauper. . .", cf.App.4(g), App.6(d10).) ¶(Figures of elements and spheres, cf.App.5(h4), with short canons.) **72r+** (Sacrobosco, Compositus.)

The calendar of N shares a few feasts with D which may have their origin in Southern France or in some order, such as: Giliberti (Fili-,D) cf., Feb.4; Salvi ep.(cf.), Sep.10; Martini ep.cf., Nov.12(2nd hand in D). Some feasts in common with the first hand of Oa could be there for the same reasons: Pantaleonis m., Jul.27; Sabbe ab.(cf.), Dec.5; Eustachii (m. & soc.), Sep.20; Chrysanthi et Darie, Oct.25. The two last-mentioned are also in Mj Ly. Cf. Roberti ab., Apr.24, in common with Kt.

Other examples of feasts either Southern French or monastic: Fulcranni, Feb.13; Trl.Antoni, Mar.17; Illatio Fidis, Mai.4(Rodez); Baudilii m., Mai.20; de ordine minorum+Antoni cf., Jun.13; Rufine et Secunde, Jul.10; Antoni cf. atque (?)parentis, Jul.16; Grati,Ansuti, Oct.16; Naamatii, Nov.2; Pontiane (=ani) Nov.19.

Pi Paris, Bibl.Nationale, lat.11252. Paper, 20½ × 14½, ff.II+203, written in 1473 at Masevaux/Masmünster, near Mulhouse (Manuscrits datés III,1974, p.227). Contains, i.a., Alfonsine Tables with canons, and astrological texts in French. Notes from inspection of ms.

Czerny 1871,160-1. Zinner 1925 no.2072; 1936 no.16. OP 4.51.

1r (Upper mg., contemporary, not text-hand:) Iste liber est monasterii sancti Floriani Pat() dioecesis. ¶(KAL.CANON B, ending like KAL.CANON B(h1):) Quaere inter numeros. . . a media nocte praecedente, et sunt horae aequales. Transactis autem. . . et habebis intentum. (:Hdg.): In ista parva. . . per annos domini. (:Letter table 1292-1723.)

1v-7r (CALENDAR(Cycl,Naur,D,Dfes+Comp,Alts,Qdie,Dmen).) (:Hdgs.: Cycl, "Cyclus p(rima) luna", missing for some months. Dfes, number of days, lunatio, reg.fer., reg.lun.) (:Additions: "Nox habet horas. . . dies. . .", not all months. To June, 4 verses, Walther 19936 "Uxor abiit 2^a. . .") **7v+** (Sacrobosco, Compotus.)

The calendar has belonged to a house of the Augustines, but is not liturgical and shows no certain influence from any order. It contains a lot of non-local feasts, but also some which are concentrated about Salzburg/Freising, such as: Altonis cf., Feb.9; Quirini m., Mar.24; Ruperti ep., Mar.27; Helene regine, Apr.15; Trl.Elisabeth, Mai.2; Trl.Quirini, Jun.16; Trl.Nicolai, Jul.9; Marini, Nov.15; Trl.Corbiniani, Nov.20. As a curiosity one may note a few feasts typical of Northern Germany and Denmark: Lucii pp.m., Aug.26; Fortunati pp., Oct.15; Leonis pp., Nov.10.

Sg Sankt Gallen, Stiftsbibl., 610. Paper, 2^o, pp.521, 15th c. Microfilm p.13-38.

Scherer 1875,196-7. Eneström(1885,3)25 no.17. Zinner 1925 no.2077 and no.5364+p.446; *id.* 1936 no.15. OP 4.52;9.2.

12 (blank.) **13+** (A calendar (App.5(j9)) with 4 cycles of conjunctions, starting 1404; first value 8 1^h;19,59 at Jan.2. With various auxiliary tables, as follows:)

13 (Table giving golden numbers for the calendar, otherwise similar to a Letter table, 1403-2752. Hdg.): Tabula ad inveniendum aureum numerum quattuor cyclorum per annos domini, et hoc quo ad annos futuros. (:Canon:) In ista tabula sunt quattuor cycli sive lineae aureum numerum continentes. . . intra tabulam annorum domini et accipe numerum viciniorem annis domini hoc anno quo scire desideras, et qui sit minor eisdem annis, et super eundem numerum computa descendendo per lineam aureum numerum continentem, annis domini sup[er]positam, donec compleatur numerus annorum domini anni in quo quaeris. . . esto quod anni domini sint 1422, quos invenies in capite secundae lineae versus dextram computando. . . erit annus bissextilis etc. (:Paraphrase of a text similar to Kal.canon B(h).)

¶(Table, hdg.): Tabula continuationis coniunctionis. . . ad meridianum Wienensem. . . **14-25** (Month-tables of the calendar, including a sub-

table with lunar letters App.4(e2), cf. table at p.26.) **26** (Table, 27 × 19, with lunar letters in series of 27, App.4(e2). Hdg.:) *Tabula signorum motus lunae, ad sciendum in quo signo sit luna qualibet die.* ¶(Notes on phlebotomy, among which the verses App.6(d10) "Luna vetus veteres. . .".) **27** (Table "Motus lunae", 30 days, last value 1°50';17: App.4(d).) ¶(Table "Motus solis", 31 days, last value 30°;33.) ¶(Table "Sol in principis mensium", 9°18';15 for January.) ¶(List of computational variables, for a cycle of 28 years, with a canon which makes the list start in 1401. App.5(e1).) **28** (Table (19 × 11), with numbers between 7 and 10, App.5(d5). Hdg.:) *Tabula ad inveniendum intervallum per taxillos.* (:Canon, on interval Christmas-Invocavit:) *Ad inveniendum intervallum secundum practicam istius tabulae. . .* ¶(Table, 35 rows, to be entered with golden number+Sunday letter (cf.App.5(b)), giving the intervals 6*3^d-11*2^d. Hdg.:) *Alia tabula de intervallo, computando usque ad dominicam Invocavit.* (:Canon:) *Intervallum per praesentem tabulam sic invenies, vide primo quis sit aureus numerus. . .*

29 (Table with the usual values of Qdie, starting in January. Subscr.:) *Tabula quantitatum dierum artificialium in horis et minutis secundum Petrum de Dacia.*

30-31 (Canon to the calendar at p.14-25:) *Ad inveniendum novilunium sive coniunctionem solis et lunae secundum medium motum, vide primo quis sit aureus numerus. . .*(makes the calendar start in 1404, and mentions Vienna). . .continuare poterit qui tunc vivet iuxta tabulam continuationis supra scriptam. . . **31** (Canon to the lunar table at p.26:) *Si scire volueris in quo signo sit luna qualibet die, considera diem in qua haec scire desideras. . .* ¶(Sign-book, App.6(d10):) *Aries est primum signum in ordine signorum, caput et alias partes capitis respicit. . .* **32** (Hdg.:) *Nota de minutione sanguinis.* (:Txt, cf.App.6(f):) *De minutione sanguinis de vena si quis exquisite. . .* **33** (Hdg.:) *De motu lunae.* (:Txt:) *Lunae medium motum si noscere quaeris, invenies primo medium motum solis. . .* **33-36** (Prayer consisting of memorial words for intervals Christmas-Estomihi, beginning "Salve praeclara caelorum regina advocata" (:T&K 1371; Bischoff, *Mittelalterliche Studien* II,1967,207 n.64).) **36** (Table, 19 rows, of interval Christmas-Invocavit, cf.App.5(e1). First row, for golden number 1 giving week-number 9:) *Si littera dominicalis est F vel G, tunc 8.* ¶(Short note on other computational variables.) **37-38** (Advice on phlebotomy, cf.App.6(f), text beginning "Primo cui detrahitur sanguis. . ."; then about some medicine for the eyes.) **39** (a few verses in German, headed "Sancte Galle". Rest of p.39 blank.)

§3-5. *Table of conjunctions (Cycl). Choice of reference manuscripts.*

§3. *Cycl, numerical variants: general remarks.*

The textual tradition of the table of conjunctions, the only part of the Calendar whose authenticity is not in doubt, will be discussed in §3-5: a list of the manuscripts is in §4a. The results will mainly be of use in the criticism of the pieces which accompany the table and the Calendar in general; in fact, as noted below, the table itself can be recalculated without extensive sifting of evidence, with results closely corresponding to some of the manuscripts.

The table serves to indicate the times of 940 mean conjunctions of the sun and moon, for the 76 years 1293(Jan.-Dec.)-1368. It is divided into four columns, here termed "cycles", each of them covering 19 successive years denoted 'A'-'T'. Within each cycle, these letters are entered against the dates where conjunctions occur: thus, any cell containing an 'A', in the first cycle, indicates the day of a conjunction during 1293 Jan.-Dec. Within such a cell, a number from 1 to 24 shows the hour after midnight within which the conjunction occurs; and the current quarter of that hour is denoted by a dot in one corner of the cell, beginning with quarter-value 1 at the upper left corner, and continuing clockwise. If there is no dot, this means a

time at the end of the hour (as stated by the canons; in fact, within the last minute). It has happened 15 times that dates within one cycle have coincided: in a cell thus doubly occupied, a red dot ("", in the text here printed) belongs to the rightmost entry of the cell. In all this, except the quarter-dots, our Calendar imitates its predecessor, by Grosseteste (§10 and App.5(j1)).

The table was re-calculated as described in the *Introduction*, §21. There are only some 12 places where the results are contradicted by a considerable part of the manuscripts (§4b), and none of these appear to offer a consistent alternative. Thus it was decided to print the re-calculated values, only following the manuscripts at the four places which were left ambiguous in the calculation (*Introd., l.c.*).

The manuscripts have been collated against the re-calculated table. The collation took account of quarter-values, hour-values, and displacement of whole cells. The letters were ignored, and vertical "slides" within columns tacitly adjusted. Most of the manuscript tables are physically well preserved: see §4a for the larger omissions. At a few isolated places, mostly in the manuscripts Y Wu Pr Ly Kt, where the microfilms were difficult to read, I may have tended to interpret the remains according to the collation copy.

Revised tables are found in Oa, where the hour-values have been augmented by one, and in Bv Mk So Bs, where an attempt has been made to up-date the tables (cf. App.1(c)). In both cases the values were reduced before collating. As concerns Bv Mk So Bs, they follow the canon (e.g. App.2(h2)) in failing to decrement an hour-value when the quarter-dot is shifted from 1 to 4, and they have not revised the quarter-values in cells where they found no quarter-dot. Also, a test of a couple of months showed a fair similarity in errors. Thus they probably all descend from one revision. I have collated only So fully; wherever an error emerged, I followed So unless the three others were against it. The resulting pseudo-majority is called "Z" in the sequel and treated as one manuscript.

The variants cited in §4 are strictly a selection, only meant to give a basis for the classification proposed. Counter-examples are many, due to scribal revisions and fortuitous coincidences; I do, however, believe to have given a fair sample of the variant groupings frequently encountered. I have not cited variants for doubly occupied cells: they are mainly intact in ms.K and the manuscripts of Class a₁, but are

much garbled in most of the other manuscripts. Neither have I cited quarter-variants for the cells expected to lack quarter-dots: for their state of preservation see §4a.

§4. *Table of conjunctions (Cycl): classing of witnesses, with a sample of numerical variants.*

§4a. Symbols for classes; commas or semicolons separate some of the sub-classes discussed in §4 b-n.

Comments:

k:	K, Sc, Fp V, L S Kr; D N, Pd	Pd: quarter-values missing on days 1-31
		D: days 1-31 missing
a ₁ :	Cj, H, G, P, Q, F, R B, Or	Q: days 1-16 missing
		Or: quarter-values missing throughout
a ₂ :	Oc; Y, T W; Sf	
a ₃ :	C Ca	
b ₁ :	X, Re E Ma, M O, Md; Pl, Da; Ml	Ml: quarter-values missing throughout
b ₂ :	Wu Mf; Mg	
c:	Mt, Z, Pr Pe	Z = So, Bv Mk Bs; cf. §3
d:	Kt Oa A Fl; Mj, Ly	Mj, Ly: quarter-values occur but are ignored in the following, cf. below.

"a" means the consensus of a_{1,2,3}, and "b", the consensus of b_{1,2}. "a(>Or Sf)" means "Class a except Or Sf".

Entries are negative except in §4b. An entry such as "**9,1,q4**: (3) Mg; (-) Ma" means "in the cell at day no.9 of the year and in cycle 1, the quarter-value re-calculated as 4 is shown by all witnesses present (cf. Comments above), except that Mg has the value 3, and Ma shows no quarter-dot". An entry beginning like "**9,1,h3**: ..." signals variants in hour-values. In positive entries, used in §4b, symbols for classes or single manuscripts which have the re-calculated value occur just after the colon.

The quality of the manuscripts, leaving contamination and self-correction out of account, can be estimated by comparison with the re-calculated table. Of the 940 hour- and quarter-values, those in the 15 doubly occupied cells were ignored, leaving 910 sets of values compared. The following is an abridged count of errors, including omissions and additions; shifted cells were treated as if in their proper places.

Quarters: 6-15: K F Cj Sc B Q. 18-35: H R P V Fp G. 42-58: W Oc T Z S L. 62-85: D C Ca Mt A Re. 92-125: E Fl N Pe Sf X. 132-147: Ma M O Y Pd Oa. 170-197: Pr Da Wu Mf. 242-291: Md Kr Pl Kt. 480-594: Mg Ly Mj.

Hours: 1-4: K R F B Z P. 5-11: G L Fp H Mt Cj. 13-23: Sc Or Q Re Fl V A. 28-34: N E C Oc Ca Pr. 38-43: Mj Ly X S D Ma. 46-57: Ml T Kt Sf Y M O Da W Pl. 64-99: Md Kr Wu Pd Oa. 101-187: Mf Mg.

Thus, with few exceptions, the most correct values occur in Class a₁ and part of Class k. More than half of the quarter-values in Mg Ly Mj are omitted or wrong; in particular, Ly Mj mostly have values of 2 or 3, apparently at random, so that it was decided to ignore Ly Mj when citing quarter-variants below.

The 14 cells calculated to lack quarter-dots (not counting two which enter into doubly occupied cells) have been supplied with dots in only 0, 1, or 2 cases by the witnesses K H Q G, F P R B Cj, V D; on the contrary, in 13 or 14 cases by L Ma X Oa Kt Mj, E M O Md Pl Da. Thus the most correct witnesses are mainly the same as above. L is peculiar in presenting 9 values of "4", whereas Oa has 6, Kt 5, and all other manuscripts less. Such values may result from attempts at filling in a cell from that situated 14 days earlier: indeed, since 49 synodic months equal 4 years minus 14 days and about 1¼ minute, values will often be found repeated at that distance. It may be guessed that other attempts at correction were made at least in Class d (§4n).

An example of the evidence for an un-dotted cell may be taken from that calculated to stand for a minute-value of just about 59^m, thus:

169,2,q?: (-) k(>L) a(>Oc Sf) A Fl; (4) L; (3) Sf; (2) b c Kt; (1) Oa Oc

§4b. *Errors in several classes. Class k.* The following is a list of those errors which were found to pervade significant parts of several classes, plus a few further ones later referred to:

- 91,1,q2:** k Oa; (1) a b c A Fl; (3) Kt
129,2,q4: *nusquam*; (3) k(>D N L) a₁ a₂ c d(>Kt); (1) a₃ b(>Mf) N;
 (2) Kt; (-) D L Mf
164,3,q1: k Wu Mf Kt; (4) a b₁ Mg c d(>Kt)
165,3,h23: L Pl Mj Ly; (22) k(>L) a b(>Pl Mf) c Oa A Fl; (21) Mf Kt
178,3,q3: k G W Sf Da A Kt;
 (4) a(>G W Sf) b(>Da Pl) c Oa Fl; (2) Pl
192,4,q1: k(>D); (2) D a₁(>P) Sf a₃ b(>Pl) c d; (4) a₂(>Sf); (3) Pl;
 (-) P
243,3,h22: k R a₃ Pl b₂ Mt Z Mj Ly;
 (21) a₁(>R) a₂ b₁(>Re Pl) d(>Mj Ly); (12) Pr Pe;
def.Re
273,1,q2: L Mg; (1) k(>L Kr) a b(>Mg) c(>Mt) d; (-) Kr Mt
299,4,q4: Fp V S D N; (1) K Sc L Pd a b(>Ma Mg) c d; (2) Kr; (-) Ma Mg
302,4,h16: k Ml b₂ c Mj Ly;
 (15) a b₁(>Ml) d(>Mj Ly)
342,4,h20: k(>S Pd) a₂ b(>M Mg) c d(>Oa),
 (29!) a₁(>Q) a₃; (19) Q Oa; (10) M S; (5) Mg; (2) Pd
349,1,q3: k(>N) A; (4) N a(>Y) b(>Ma Mg) c d(>A); (-) Ma Mg Y
349,2,q1: k(>L N) Md Kt A;
 (2) L N a b(>X Ma Md Da Mg) c d(>Kt A); (-) X
 Ma Da; (3) Mg

Class k is the collection of witnesses which are mostly correct at these places, such that the remaining ones form a group against them. Of those which occasionally follow k or are right against it, Pl and Class d have probably been corrected secondarily (§ 4n), as may also be the case for L (§4a).

§4c. *K, Sc, Fp V, S Kr, L (Class k).* The manuscripts assigned to Class k vary much in quality. Manuscript K only has the errors at 129,2; 165,3; 273,1; and 299,4, above, plus three more, namely, 113,3 (q-, alone); 199,1 (q1, with M Oa); 318,3 (q-, with Mf); in each case some manuscripts show other errors. Thus K appears to be independent of all the others.

Fp V S Kr form a group with the sub-groups Fp V and S Kr. Outside Class k, this group as a whole has some inconclusive correspondences with Classes d and b₁. The list below includes most of the variants common to Fp V and to S Kr.

Sc appears to be fairly independent within Class k. It sometimes corresponds with Fp V S Kr, especially with Fp V. Outside Class k, it has quite a number of errors in common with varying parts of Classes d and b_1 . The variants repeatedly shared between Sc and other manuscripts are noted below.

L shows some connexion with Fp V S Kr, most often with S Kr. This mainly involves variants which may result from attempts to correct the table from itself. This can be supposed at least concerning L (§4a), but may of course be more common. Outside Class k, L S Kr show relationship with b_2 : examples in §4i.

As appears from the examples below, N Pd are loosely connected to Fp V S Kr, and hardly at all to Sc. See §4d for the suggestion that N D Pd form a weakly connected group among themselves.

Quarters: **29,4,q4:** (3) Fp V S Kr N; (-) Ma Wu; (2) Pl Md; *def.* D Pd **32,1,q4:** (1) Fp V Pd Md; (-) F N; (2) Mg **35,3,q4:** (3) Sc Fp V S Kr N Pd Da b_2 ; (-) a_3 X; (2) Pl **38,4,q2:** (3) Sc X Pr; (-) D Mf Mg **71,4,q2:** (3) S Kr L Wu Mg; (-) Mf **110,2,q3:** (2) Fp V S Kr L Pl M O Md Mg; (4) X Wu Mf **150,2,q2:** (1) Fp V; (-) Mg; (4) Pr **159,2,q2:** (1) Sc Fp V Kt; (-) N a_3 Md Mg Mt; (3) X **175,4,q4** ($\sim 45^m$): (3) Fp S Kr Oa; (-) Da Mg; (1) Pl **194,2,q1:** (2) S Kr; (-) Mg; (4) Z **214,2,q2:** (1) S Kr M Mg Fl; (-) Wu; (3) T **214,4,q3:** (2) Fp V; (2+3) Pd; (-) Wu; (1) Mg **217,3,q1:** (3) Fp V S Kr; (-) Mg **248,2,q3:** (4) Sc Pd Kt **269,1,q4:** (3) S Kr; (-) Mt; (1) Pd M **271,1,q3:** (2) Sc S X Mg; (-) M D **290,3,q2:** (1) S Kr; (-) Pr **349,3,q4:** (3) Fp V Pd; (1) A X Kt; (2) Pl Pr Pe

§4d. *D, N, Pd (Class k).* As mentioned above, these show scattered connexions with the rest of the class, and may be fairly independent of it. They go together a number of times in various combinations, with each other and with manuscripts mainly belonging to Classes d and b_1 . DN are connected both with Class b_1 in general (§4h) and with M O Md in particular. Pd is generally quite faulty, and shows similarities almost everywhere: some double quarter-values (cf. 214,4 above) may be the result of a mixture of some normal text with

readings mainly from various parts of Class k; and coincidences with Da and Class d are found repeatedly. The list below includes those instances where at least two of D N Pd coincide, plus a few further ones.

Quarters: **54,2,q4:** §4h **59,3,q3:** (4) V; (3+4) Pd; (-) Mt Fp; (2) Pl Kt; *def.Sf* **74,2,q1:** §4h **75,3,q4:** §4h **81,1,q4:** (1) D Pd X **87,1,q4:** (1) D N; (-) Ma Md Mt Pr; (2) Wu Mf **91,2,q4:** (3) D Da Oa; (-) Kr **104,4,q4:** (3) D N Pl Kr; (-) Kt; (1) Y Mt; (2) Pd **108,2,q2:** (1) D N Pd; (3) Pl; (4) Mg Kt **147,2,q3:** (4) Oc Y T W; (3+4) Pd; (2) Kt **149,1,q3:** (2) S; (2+3) Pd; (-) L **155,2,q4:** (1) N Pd Mg; (1+4) Sf **207,2,q4:** (2) N Pe; (2+4) Pd; (-) Da M Md; (3) Oa **226,4,q2:** (1) Kr; (1+2) Pd; (-) Mf; (3) Mg Kt Pr Pe; *def.Sf* **262,3,q2:** (1) D N Pd S Oa Kt; (-) O Mg; (2+3) Mt **264,1,q2:** (1) D N Pd Mf Kr; (3) Oa **267,4,q2:** (1) N Pd Q; (3) Md; (4) X; (-) Wu Mf **293,2,q3:** (4) D N Pd; (-) Kr; (2) A **326,1,q1:** (2) Kr Pd; (4) Md **335,3,q4:** (3) Pd Da; (2) Pl

§4e. Class a_1 . Cj H G P Q F R B Or have the errors §4b in common with each other and with varying sets of other manuscripts: one may note the senseless error 342,4, shared with C Ca, and with Oa if one further error is assumed to be an attempt at correction. Apart from that, the members of this class are those which have only scattered and incoherent errors, thus appearing to be mainly independent of each other and of the rest. The only exception is R B, with the common errors

15,1,q1: (2) R B; (-) S Md Mg; *def.Q* D Pd **15,2,q3:** (4) R B; (-) Y Pl Kr; (2) Kt; *def.Q* D Pd **15,3,q1:** (2) R B N Pl; (-) Md Mg Pr; *def.Q* D Pd **15,4,q3:** (4) R B; (-) Kr Y C Ca Pr Oa; (2) Mf; *def.Q* D Pd **76,2,q2:** (1) R B Fl; (-) D Da; (3) a_2 Wu Mf Kt Pe; (4) N

R is right against B in 243,3 (§4b), and has two quarter-errors against B elsewhere. At least these two manuscripts are very close.

§4f. *Class a₂.* A stable group consists of Oc Y T W, with the sub-groups Y T W and T W. In the beginning and end of the text, Sf is fairly constantly associated with this group, as a whole; elsewhere Sf is connected at least to Class d (§4n). The group may be loosely connected to L S Kr and to b₂, but generally it appears to be fairly independent.

§4g. *Class a₃.* C Ca are almost twins: they seem to have the same quarter-values, whereas Ca has two errors against C in hour-values at 138,1 and 181,4. It may be remarked that errors are scarce in the second half of the year. The connexions of this group with a₁ and b₁ are exemplified in §4e and §4h. Other instances:

§4h. *Class b₁.* The stable core is the group Re Ma E M O, called "m" in the following, with the sub-group M O.

These groups are regularly, and apparently independently, joined by X, Da, Md, and Pl. X and Da have errors in common with m as a

whole, but rarely with sub-collections of it; X has no definite affinity elsewhere, whereas Da often joins Class d. Md and Pl have errors in common both with m and with M O in particular. Md is connected with b_2 also, in the later part of the calendar. Pl is only attached to the present class as concerns quarter-values, and is connected to Class d in both kinds of values, so that its assignment to Class b_1 is arbitrary.

Some sparse coincidences, both with m and with M O in particular, are shown by D, N, single manuscripts from Class d, and Ml, the last one of which has been kept in the present class for convenience. Group a_3 also joins m in a few instances.

Cell shifted: **323,4:** *ad* 322,4 c; *om.Y*

§4n. *Class d.* Kt Oa A Fl often join each other, in varying combinations, and may be thought to constitute a loosely structured group. They were seen often to associate with Group b₁ as a whole, and with Group b₁+b₂, the latter especially as concerns Fl. More particular affinities appear towards Pl Da (Group b₁), Sf (a₂), Kr and D (k), and towards Mj Ly (below). The groupings so formed are quite unstable and cannot apparently be taken to indicate any definite relationship or any structure within the class. This may be partly due to contamination of the table from itself (§4a), examples of which may occur in the hour-variants at 214 and 228 and in the shifted cells at 120 and 134. I cite some groupings which involve at least three of Kt Oa A Fl Pl Da Sf Kr D, Mj Ly (hours), plus some recurrent groupings of two manuscripts only, always containing some of Kt Oa A Fl.

Quarters: **34,4,q2:** (1) Fl Da; (-) Mg Pr Kr; (3) X **38,1,q3:** (2) Kt A Fl; (1) Y Md; (4) M O **40,2,q4:** (3) Kt Oa; (?) Ma

Cells shifted: **120,3-4**: *ad* 2-3 Oa Kr Md; *om.*S Pd **134,3-4**: *ad* 2-3 Oa Kr

It is seen that Mj Ly may combine with Pl and with some of Kt Oa A Fl. The hour-variants in question are mostly one more or less than normal, a type which is not as frequently seen in the rest of the material. If this is due to some sort of systematical emendation, dependence grows less certain. Most of the variants which connect Mj Ly among themselves are also of this type, e.g.:

Hours: **41,1,h17**: (18) Mj Ly; (15) Wu Mf Mg; (11) Kr; (1) Fp **124,2,h14**: (13) Mj Ly; (24) Wu Mf; (16) Mg; *def*.Y **277,1,h23**: (24) Mj Ly; (13) Wu Md Sf **293,1,h20**: (21) Mj Ly **324,2,h14**: (13) Mj Ly; (4) Sc **340,1,h10**: (18) Mj Ly O Ma Md; (15) Da; (16) M E; (17) Kt; (20) N

Cells shifted: **37,1-2**: *ad* 2-3 Mj Ly (cell 1 filled in with h3,q3) **37,3**: *ad* 4 Mj; *om.*Ly

For convenience Mj Ly may be assigned to Class d together with Kt Oa A Fl. In any event this grouping is unsatisfactory, since the witnesses concerned are quite faulty (§4a), and probably revised and/or contaminated as well: thus, since they are more likely than others to give rise to fortuitous coincidence of readings, this class cannot lightly be adduced as a source for readings in particular cases. It may be safe to assume a connexion with Group b₁, and Pl Da Ml show affinities

both ways. Further, Sf approaches this class at some of the places where it does not follow a_2 . Other observations are hardly conclusive.

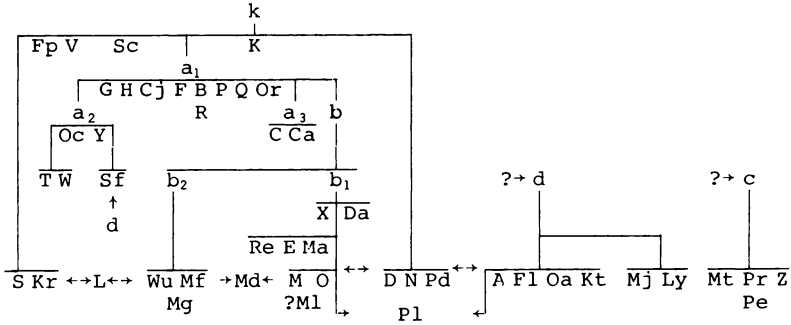

§4p. *Index to the variants cited in §4b-n.* Under each day-number, during the year, the entries mean "cycle number, section(s) of this §". It is not noted whether the variant has to do with hours, quarters, or shifted cells.

§5. *Summary of the tradition of Cycl. Choice of K Sc Fp V a_1 as reference manuscripts.*

In the following suggested stemma, manuscripts or classes related in an indeterminate manner are juxtaposed or connected with horizontal lines. Class c cannot be very definitely located; and distinctions are

hazy between b_1 , D N Pd, and d. I have noted only the most obvious contaminations; any unnoticed ones will tend to be located too far up, such as may be the case for X and Da.

When considering the kind of variants used in §4, and thus excluding cells doubly occupied or lacking quarter-values, one efficient way of recovering the values of the table would have been to accept the majority reading of K, Sc (or Fp), and the majority of a_1 . This would yield only 3 or 4 errors (§4b, 129,2; 165,3; 273,1; 299,4). In this sense we may confidently expect to possess a faithful picture of the original table.

In trying to determine what sorts of frame-work were used for accommodating the table near the beginning of the tradition (cf. §6, §10), one might, then, choose the manuscripts K Sc Fp a_1 as a basis of reference. This will be done in the following, with inclusion also of V as a supplement to Fp, and occasionally of Oc Y because of the comparative independence of their numerical material. Of Class a_1 , Or has been dispensed with, since the change of scribal hands justifies some doubt as to the uniformity of its sources.

§6. Relation and environment of the Calendar and T.L.

The following shows the inventory of the reference manuscripts plus Y Oc, lesser notes excluded.

Abbreviations:

- K Calendar
- KcA Kal.canon A
- KcB Kal.canon B

- G Tabula Gerlandi+contratabula (App.5(a))
 GcA Tabula Gerlandi, canon "Quaere" (App.5(a1))
 GcB Tabula Gerlandi, canon "Ad compositionem" (App.5(a2))
 GcC Tabula Gerlandi, canon "Theorica" (App.5(a3))
 T T.L.
 Tc T.L.,canon
 * alternative texts to the above, see notes
 Xn other texts or tables, numbered for each ms.; see notes
 (subscript) secondary hands
 ; other matter intervening in ms.

Inventory:

R	KcA+Tc,	K,	G,GcA, T
Y	KcB,	K,	T, KcA+X1+Tc
Oc		K,	T

Notes:

- K: X1, a *rota* on Easter limits, App.5(g2). X2, "tabula terminorum", App.5(d1), and a canon. X3, a canon (banal) to the solar tables X4 (see pa17) and the table of declination appended. Tc*,T*: App.4(b).
 Sc: X1, list of Easter limits (App.5(e1)) and some memorial verses.
 Cj: KcA*, Grosseteste's canon, adapted, App.1(d). X1: short note on Tab. Gerlandi.
 Fp: Tc*, T.L.canon(d1). X1: a canon for solar longitude (App.1(a1)).
 V: Tc*, T.L.canon(d5).
 P: KcB*, letter table only.
 F: X1, various notes on computus etc. (one of them in App.1(b)).
 B: X1, data as X1 in Sc, above.
 Y: X1, on solar longitudes, as in Fp.

The arrangement

Kc, K, G,GcB, T,Tc,X1

is that of the Grosseteste-calendar App.5(j1) in Wien 2367, with Kc="Ad habendam notitiam", T= the 12 × 12 *Tabula lunae* (App.4(a)); Tc=App.4(a2); and X1= the solar tables 1292-5+a table of declinations (§17a). – Paris St.Geneviève 1043 has a similar arrangement, but with some permutations and extensions, and the old undated solar tables (§17a) for X1.

Thus, the collection *Kal.canon A+T.L.canon; Calendar*; the tables of Gerland with some canon; and *T.L.*, may be intended to imitate some version or versions of Grosseteste's calendar. The collection is at least early, being predominant in Class a₁(§5). Thus it is not unlikely that the author intended these elements to be released all at once. However, some quite notable manuscripts omit *T.L.*, a fact which seems to call for comment upon its coherence with the Calendar.

T.L., or at least its canon, no doubt presupposes a version of our Calendar, equipped with the *Cycl*-table and a set of accepted dates for the entrance of the sun into the zodiacal signs ("solar dates" in the following: see §17). Conversely, *Cycl* (and the canons to the Calendar) does not require *T.L.*: in fact, one might copy the values of that table into any frame-work resembling Grosseteste's calendar (see §10), preserving, *i.a.*, the old and obsolete solar dates (at XV Kal.) and/or ignoring any *T.L.* at hand.

Among the manuscripts listed above, something like this may have happened in K Sc Cj H. All of them (plus the first hand of Fp) leave out *T.L.*; and the same four witnesses (plus Oc) are those which keep the old solar dates. The scribe of K, at least, probably did not know *T.L.*, since he annexed another table to the Calendar. Sc shows no trace of *T.L.* or similar tables. Since these two manuscripts appear independent in other respects (§4c), one might take them to represent an earlier stage of the tradition, where the *T.L.* did not yet exist. As concerns Cj H, it is at least fairly certain that some Grosseteste-calendars were the recipients of *Cycl*. Indeed, Cj H are those which consistently retain the headings for *Cycl* from Grosseteste (§12), and Cj even keeps the canon of that calendar. But H, at any rate, had access to *T.L.*, since *T.L.canon* is added by a hand which is probably still the text-hand. The first hand of Fp may simply have had no room for *T.L.*: in fact it curtails *T.L.canon* for a similar reason.

Of the remaining manuscripts which have *Cycl* but not *T.L.*, Kr T Sf O Wu Mf show the old solar dates; Mg Mt Kt Ly have other sets; and

E Da lack the dates as well. Conversely, Oc Pl Pr A have *T.L.* plus the old solar dates. It seems that no conclusion can be drawn.

T.L. often occurs apart from the Calendar, mostly taken over by later calendars (§22). The copies of the *T.L.* with the usual canon which occur apart from calendars (E2 E7 Lh Lp P3) seem to have no stable alternative environment. The remaining loose instances are mostly late and accompany various astrological pieces. *T.L.* is found twice in the company of older calendars; once (M8) as a result of secondary adaptation, and once (O4) as part of a transfer which also includes part of *Kal.canon B*. A third case (Ca) is dubious.

Thus, since *T.L.* is probably meant to depend on the Calendar, and since in any case the practice of uncontrolled copying makes it inherently impossible to demonstrate the priority of one over the other, one should reproduce them as parts of one collection.

Other pieces reproduced: *Kal.canon A* (§7) is the one mostly found at the head of the collection in the reference manuscripts, whereas *Kal.canon B* (§8) is more sparsely attested. I have placed it arbitrarily after *Kal.canon A*. The tables of "Gerland" are reproduced in App.5(a), together with the three canons repeatedly found in the reference manuscripts.

On the whole, then, the environment of the Calendar here printed, with inclusion of the tables of Gerland, reproduces the contents of the collection found in Class a₁, more or less supported by Fp V of Class k. It thus excludes the computistical and astrological additions found in abundance in many other manuscripts. Most of them have been listed in Appendices 5-6; for some pieces with stray ascriptions to Peter of Dacia see App.4(a,c) and App.5(b,c), and cf. *Introd.* §4.

In the reference manuscripts, the wider environment of the Calendar with auxiliaries shows a few recurrent forms, which are all computistical rather than liturgical, and could also be expected for calendars of Grosseteste. The manuscripts begin with these pieces, except V, F, H (only with Balduinus' *Computus manualis* near the beginning), B (only with Alexander's *Algorismus* preceding). In Sc the collection seems to stand alone. In Fp Cj P it is followed by Balduinus; in R Q H B, by Sacrobosco's *Algorismus*; and in K and possibly G, by Sacrobosco's *Computus* (with the *Theorica Planetarum* intercalated in K). For F, V, and the rest of the manuscripts, the descriptions in §2a

and §2b will give an idea of the environments as far as I have had the means to check them.

§7a. *Kal.canon A.*

Manuscripts: KScFp, HGPQFRBC,Y. Sc has two versions, here called Sa and Sb. The occurrence of this canon in significant parts of the classes k and a₁ (§4-5) offers a strong presumption that parts at least are authentic; cf. OP p.21. A dating before 1311 is implied by l.19-24.

Ascriptions connected with the text: "mag. Petrum Philomenam de Dacia" (K, concerning Calendar); "mag. Petri de Dacia dicti Philomena" (Sa,Sb, concerning this canon, plus the Calendar in the latter case).

The text of l.1-45 looks like a straight adaptation of Grosseteste's canon (App.1(d), in the version of Cj). Some passages are repeated verbatim; additions are l.17-26, on reckoning from the year 1292 (extracted by Cj. *l.c.*, and added to Grosseteste's canon), and of course the sections on the quarter-values. Grosseteste's limits 38,57,76 for changing cycle were augmented by one for clarity (and re-introduced by a corrector in F). Our text, like its source, only mentions the table of conjunctions. A loosely attached addition, on William's table of solar longitude, is printed in App.1(a1).

Apart from the revisions mentioned below, and some lesser variants in H Sa (Sb), there seems to be no significant way of structuring the tradition. Thus I print the main text, ll.1-45, from the majority of the manuscripts present, recording all variants (§7b).

At l.7-28 H Sa have an abbreviated text, which compared with Grosseteste would seem to be an innovation. I have printed this from H, with only two departures.

The additions l.46-73 are in H Sa (46-8 also in Sb, probably from Sa like some readings elsewhere), Y (some text including 46-8 having disappeared in a homoeoteleuton); l.49-65 are in K in a slightly different version. The instructions for renewing the calendar give the first new conjunction as 1369 Jan.8, 21^h plus 5-6 minutes after midnight (K; hours one less in H Sa Y). This value, within one or two minutes, can be obtained both from the Toledan Tables and by extrapolation from the Calendar (*Introd.* §21). Thus the correction for the difference in longitude between Toledo and Paris has disap-

peared in some way or been neglected, a fact which throws doubt upon the authenticity of the "tabulas meas supra Parisius (H Sa; latitudinem *add. K. inepte*)" at l.49-50, and thus on the whole passage. But still the manuscript evidence is good. I reproduce these additions from K and from the majority of H Sa Y, recording all variants.

A fragment of our text (l.17-23, col.a) is in Cj, as mentioned above. Another one, l.43-45, on the renewal of the Calendar, was fetched into the versions of *Kal.canon B* shown by Oa, Pr Bo Pe, Mt, Sf, Bv Mk So (see App.2(f2,h1-2)), and was used in the actual revision transmitted by Bv Mk So Bs (see App.1(c)). Variants from these fragments are not recorded in the apparatus.

Manuscripts:

(a) Text as printed:

F,S,K(secondary hand)

Y,Sf,TW – Omissions in l.29-30 and 40.

C,Ca – Omissions in l.8-10; l.40-42 abbreviated.

The passage l.37-8 "scilicet--sinistrae" is in F; TW have another version, and the rest omit it.

(b) l.23-27 missing:

Sc E Ma Or M Pl Fl Bf

Tr Ef – Compare l.44 "in complemento"

(c) *l.* 18-27 missing:

Mt Mj Ly Pd, A O4

(d)-(l) For the texts not readily collatable with that adopted, see Appendix 2.

Ascriptions connected with the texts of Classes (a)-(c) above, either in the heading (*l.* 1-2) or in some subscription, or both:

mag. Petrus Dacus(*om.* W): T W

(mag.) Petrus de Dacia: F, M Pl Bf Tr Ef, Mt Ly

mag. Petrus de Dacia dictus Philomena: Sc Ma Or,
E(+de civitate Parisius), Mj A

(Declension ignored; of several names in one text the longest was chosen.) All these ascriptions concern the Calendar, not the canon itself.

The sources of our text include the canon App.1(d) to Grosseteste's calendar (for *l.* 32-35), and *Kal.canon A* (for *l.* 34-37, 42-46). The canon App.5(a3) to the Tabula Gerlandi, used by a Dane not much later than 1290, may have contributed to *l.* 3-14, 18-19, but it is hardly well enough attested to show which way the connexion goes. I cannot find any origin for the "parva tabula", which constitutes the innovation of our text against *Kal.canon A*.

As concerns the manuscript evidence, Class (a) above may form a group and (b,c) another one, with F either contaminated or in some way independent. The comparative merits of the (a)-manuscripts, even when discounting K, speak for adopting the full text found in them. I have followed F almost everywhere, and noted all variants except trifles.

On the whole, this canon is less well authenticated than *Kal.canon A*. Of the reference manuscripts (§5, §6) only Sc has it in the place where it is normally found in the later manuscripts; F and K show it as a marginal note to the Calendar, and K at least in a secondary hand. The rest omit it, except P, which has the table only. Thus it appears to be secondary to *Kal.canon A*. There seem to be no ascriptions nor other evidence to connect it with our author. Still it might not be too unsafe to consider it the author's own improved version, especially if some weight is assigned to its connexion with App.5(a3) mentioned above.

For the additions to this canon see generally Appendices 1 and 2, and §7a, last section. Secondary adaptations for use with other calendars are found in O4,59r (variants, except those following from systematic revision, recorded below), and in Sg p.13. The "parva tabula" is found alone in P Ml Pr.

§9a. *T.L.canon* "Ad locum".

Manuscripts:

- (a) Reading "sinistrum" (l.9), and mostly the full explicit at l.16-19:

F Q G H C Oa(151v) Fp(3rb) Lh

R B P3 (omission in 13-14)

Y W (omission in 11-12; W lacks explicit)

- (b) Reading "et in toto" (l.14):

Ma E2 (full explicit as above)

Mj E7 (variant explicit)

A O4 (no explicit)

- (c) Reading "solis in signum" (l.2):

M M8 So(142v) (no explicit)

- (d) Last sentence (l.18-19) missing, readings otherwise closest to (a):
 Lp Ca (Ca with variant ending)

The paraphrases of this canon, and the other canons found with the *T.L.*, with their ascriptions, are reproduced in Appendix 3.

Ascriptions connected with the witnesses cited above, declension ignored:

- .p.da.: Ca(? , at end of text)
 (mag.) Petrus de Dacia: P3 E2 c
 mag. Petrus de Dacia dictus Philomena: Mj A O4,
 Ma(in common with Kal.canon B)

All these, except that of Ca, occur in titles referring to the *T.L.* Further, manuscript G has an anonymous subscription common to Kal.canon A and the present text. There are no titles or subscriptions of note in Class a except G P3, nor in E7 Lp.

This canon is fairly well authenticated by its presence in many of the reference manuscripts, as cited under Class a. It is there generally coupled to Kal.canon A and is probably meant to belong together with it, cf. §6.

The text here printed rests on Class a and especially on F, but with the correction to "dextram" in l.9. All variants are indicated except some glosses.

Subscriptions: explicit canon in kalendarium novum correctum G; explicit Ma, Fp (l.15); .p.da. Ca

§10a. *Calendar: ascriptions, title, locations and datings.*

For the attribution, evidence is abundant. Besides the headings of *Kal.canon B* (§8) one has, more significantly, the heading in K to *Kal.canon A* (§7) "ars istius kalendarii facti per magistrum Petrum Philomenam de Dacia"; the testimony of the author of K's lunar table, App.4(b), "quaere in kalendario magistri P.de Dacia qui magis appropinquat veritati" (OP p.23,31); and the subscription in Sc ".canon magistri Petri de Dacia dicti Philomena supra kalendarium suum ab eo noviter compilatum" (§7). Later on, several dependent testimonia can be found in different contexts, such as the "Omnis creatura" (App.6(a)). In Bv Mk So this is appended to the version of the Calendar updated by Jo. de Palmis (see description of So, §2b), who gives his own testimony (App.1(c1)). In some later manuscripts the attribution was transferred to detached parts of the Calendar: cf. §§16 and 17, to *Grad* (in Ba) and *Qdie* (in Ba,Sg), both originally from William of St Cloud; and §§17 and 20, to the entries for solar signs and the figures for day-lengths, in L.

To extend the title of the Calendar, one might consider the "kalendarium. . .noviter compilatum" of Sc, above, or the secondary ".Kl. noviter factum Parisius" of K; cf. also the subscription in G, ". . .canon in kalendarium novum correctum"; the "canon in kalendarium Lincolniensis episcopi de novo correctum", to *Kal.canon A*, reported from Salamanca 2662 (§2c); and the heading in N to the lunar table App.4(c), ". . .per magistrum Petrum de Dacia correptorem huius kalendarii". The less central manuscripts X and Pr say "kalendarium novum magistri Petri de Dacia", cf. the reference "secundum novum kalendare" in the canon App.4(a4) to the lunar table of L. Thus there is no stable title except the banal one of *Kal.canon B*.

Locations to Paris emerge sparsely, earliest perhaps in the addition of K Sc H to *Kal.canon A*, mentioning the otherwise unknown "tabulas meas coniunctionum supra Parisius" (§7, and *Introd.* §3b, §21, with discussion). Paris is also mentioned by a secondary hand in K (above); in the extended rubric to *Kal.canon B* "kalendarium magistri Petri de Dacia dicti Philomene de civitate Parisius" of E; and most explicitly,

but least reliably, in the subscriptions of Bv So to *Kal.canon B* ".kalendarium magistri Petri de Dacia compositum ad meridianum Parisiensem" seen by Zinner (1936,324) in Bv (cf.OP p.9). Thus the express evidence, even if distinct, is scattered and has hardly followed the tradition of the Calendar proper. One more location is shown by the planet-table of Lo (App.6(b)). See generally *Intr.* §8.

Datings, to the year 1292 and concerning *Cycl*, are found in the canons of Oa Bv Mk So Bs (App.2(f2,h2), App.1(c2)). Oa has "et fuit iste kalendarus factus anno domini 1292, et iste numerus ponitur in principio primi cycli". Thus the year was obviously read off the letter table of *Kal.canon B*.

§10b. *Sub-tables and arrangement of Calendar.*

There is one express testimony, in Par.lat.7281 (14th c.),146v, in a gloss on William of St Cloud's canon for the *Kalendarium reginae* (seen by E.Pouille):

Petrus Dacie fecit similiter kalendarium, in quo ponit 4^{or} cyclos primationum, incipiendo anno Christi 1292 pro litteris inveniendis, deservientibus annis usque ad 1653. In kalendario ponit primo illos 4^{or} cyclos decennales cum litteris, numero horarum et punctorum; deinde numerum aureum; deinde litteras feriales; deinde numerum idus nonarum kalendarum; deinde festa sanctorum; deinde quantitatem cuiusque diei artificialis; deinde altitudinem solis meridianam. Et incipit diem et horas eius a media nocte praecedente.

The author of the gloss appears to have seen a copy of the Calendar with Canon B and the sub-tables (*Cycl*,*Naur*,*D*,*Dfes*(+*Comp*?),*Qdie*,*Alts*), which, if exactly rendered, would point to a copy like the mid-14th c. French Pl Mj (or the German or Swiss M Md Bv Mk So). In other words there is nothing to show that this testimony goes beyond our tradition.

Thus, the only first-hand evidence seems to be the silence of both Canon A and B about any sub-table but *Cycl*, as contrasted, e.g., to William's complete inventory of his calendar (App.5(j2)) including the tables *Alts*,*Qdie*, and *Qnoc* appearing in many of our manuscripts. The presumption is, then, that only the table *Cycl* (plus *Dfes*, carrying the solar dates to be used with the *T.L.*, see §6) need have been provided for from the beginning.

The following recapitulates the inventories of the first hands in the reference manuscripts. "Will" stands for the conjunction table of William's calendar.

K		Cycl,	D, Dfes,Comp,Naur, Dmen,Dann

(Y		Naur,Cycl,	D, Dfes,Comp, Decl,Grad,Dmen,Dann)
(Oc	<i>Will,</i>	Naur,Cycl,	D, Dfes,Comp, Qdie,Qnoc,Alts,Decl,Grad, Dmen,Dann)

The collection

Naur,Cycl, D, Dfes,Comp, Dmen,Dann

is that of Grosseteste's calendar in, e.g., Stockholm K.B.,X 767 and Wien Oe.N.B.,2367. The configuration starting with *Cycl* might of course be obtained by grafting *Cycl* on any ecclesiastical calendar; in fact this is the usual pattern in later manuscripts. Finally, there seems to be no regular way of arranging the extra tables. Apparently they could be attached to Grosseteste-calendars just as well: cf. §17a, and §2b on ms.M8,57r+.

On the whole, then, nothing indicates that any care was taken to fit *Cycl* into any particular environment including a fixed set of extra tables. It should rather be supposed that a user would imitate or even re-use the frame-work of, e.g., Grosseteste's calendar as a handy recipient. This was obviously the case in Cj or an immediate ancestor, where Grosseteste's canon has been kept as well (§6; seen by OP p.21), with some secondary adjustments.

Thus, without attempting to restore any kind of original, I print *Cycl* in a frame-work resembling Grosseteste's, sufficient to illustrate the common use of the Calendar. For *Dfes* and *Comp* I mainly follow F (see §13-14). – Since the extra tables (§15-18) might be useful for reference, they are printed alongside with the Calendar, in the order *Alts, Qdie, Qnoc* (from William's calendar), *Grad* (from William's Almanach), *Decl* (as yet unidentified). For some more tables occasionally found, see §20.

§11-20. *Sub-tables of Calendar.*

§11. *Naur* (sub-table of golden numbers). Manuscripts used: K Sc Fp V G H F B R P Q Oc. Not in Cj, where its place is apparently meant to be taken by William's table of conjunctions. Heading: "Aureus numerus" ("num.aur." Sc(Febr.),P). The table has been printed from K Sc F, which only show insignificant variants. The series is that common in any calendar from the time. Among the rest of the manuscripts examined, renewed values apparently occur in W,Bs(cf.to 12v) and in Ca.

An extra column of golden numbers for February is in K Sc, Fp(secondary hand), V H P, with the headings: "aureus numerus (a.n. om.Sc) in anno bissextili (-ti Sc) Sc Fp V H; "numerus aureus" P; "b" K. The numbers are entered one day later than normal, beginning with 19 (K H P) or 11 (Sc V Fp) and ending in 9.

§12a. *Cycl* (sub-table of conjunctions), headings in the reference manuscripts and Oc:

"Cycli (-lus Q G Oc) primationum (-nis Oc) lunae": K, Sc, Oc, P(once), Q(7 times), G(3 times). - "Quattuor cycli lunares": R(8 times),B(6 times),F(3 times). - "Quattuor cycli primationum lunae" (om.F once): V, R(4 times),B(4 times),F(5 times). - "Cyclus cyclorum (primationis add.G once) lunae": Fp, F(once),P(11 times),Q(4 times),G(9 times). -

"Quattuor cycli naturalis computi (comp.nat. B once, F twice)": Cj, H, B(twice),F(3 times).

The headings show no stability. The last-mentioned is from Grosse-teste; if there is a single one peculiar to the Calendar, it would probably be the first. The sub-heading is "1^{us}--4^{us}" in all manuscripts here cited.

Details on the edition of the *Cycl*-table itself can be found in §3 above.

§12b. *D* (column of Sunday letters and Roman dates.) In most manuscripts. Headings: "litterae feriales" K,Sc,Fp(2 omissions), G,H,Cj,F,RB,P,Q,Oc; (no heading) V.

§13a. *Dfes* (sub-table of fixed feasts). In all the mss. K Sc Fp V G, H (empty), Cj F R B P Q Oc, and in most others. Headings:

(Number of days:) "(month) habet dies (nn)" Fp V G H Cj F R B P Q Oc; (month) K (over *Comp*), Sc. - (*lunationes*): "lunat(iones)" Fp G H Cj F R B Q Oc; "lunatio" P; (no entry) K, Sc, V. - (*reg. sol.*): "regularis sol(aris)" Fp, G, H, Cj (3 times, and "r-ares s-ares" 3 times), F, R, B, P (10 times), Q ("ferialis" once), Oc ("r-ares s-ares" twice, rest variously abbreviated); "regularis ferialis" K, Sc, V, Cj (5 times, and once "r-es f-les"), P (twice). - (*reg. lun.*): "regularis lunaris": all mss. except for: "r-ares l-ares" Cj (6 times); "lunaris" Q (8 times), Fp (3 times, two of them with "vero" or "etiam"; and once "lunares").

The commonest set turns out to resemble the headings usual in Grosseteste's calendar, faintly altered in K, Sc, and partly in V. I have kept to the common readings in this case.

§13b. *Dfes*, feast-days. The martyrologies in the manuscripts vary according to locality or monastic order, at any rate for manuscripts used in liturgy. Some feasts which are taken to be locally significant have been cited in §2b under each manuscript (cf. §2b, preamble). No specifically Danish feasts have been found, except perhaps in Sf.

As concerns the reference manuscripts, the martyrologies of K Sc V are rather non-descript, whereas those in Fp, P Q G, F R B share significant features with each other and with Or, but with no other manuscript examined. These features, for which cf. §2b under ms. R, point to an origin in Paris or Northern France. It was decided to print a martyrology representing these manuscripts, since a closer location of them might be interesting, even if open to various interpretations, since none of them appear to have been liturgically used from the beginning.

Accordingly, the inventories of the first hands of Fp P F B are printed here, with inclusion also of K. Rubricated feast-days could not be discerned in the film of F, and only with uncertainty in that of Fp. I do not reproduce the words "sanctus", "beatus"; and I abbreviate as space demands. For word-order and the choice of epithets F is followed. The following symbols are used with the entries in the martyrology printed, except that rubrication of vigils is ignored:

- (no symbol): occurring in all of K Fp P F B. Entry italicized if rubricated in K (Fp) P B.
- a: occurring in Fp P F B. Entry italicized if rubricated in (Fp) P B. Elsewhere the manuscripts carrying the entry are mentioned, in italics if they rubricate the feast.

List of cases not covered by this notation (day-numbers during the year):

13 Firmini: remigii K **22** *nigrum* K **32** *rubrum* Fp **66** & Felic.: *om.*P

§14. *Comp* is a separate column from *Dfes* in K, Sc (no dividing line), Fp H Cj F P Q Oc; the two are merged in V G, and in R B, which lack most of the entries. – Headings: P Q F have "sol in (nn) gradu (sign)", where nn = 18,19,17(Mar-Jul),18(Aug-Dec). Fp V Cj H have occasional information on the start of different computistical cycles, either above this column or as general headings to pages. For other additions, which are few in these manuscripts, see §20b.

Where the columns *Comp* and *Dfes* are separate, entries may still be crowded from one into the other. I have kept the feasts proper in *Dfes* and referred the rest to *Comp*. This arrangement presupposed, the inventory printed is basically that of the first hand in F. Entries are unmarked where F is supported by at least one of K Fp P, and marked with "F" where F stands alone against the silence of the rest. Entries where a second hand in F ("*Fp.c.*" for this purpose) is supported by one or more of K Fp P, are adopted selectively, and a note is made below in such cases. Secondary hands in K Fp P are ignored, as are most of the instances of consensus among these witnesses against F. Notes, referring to day-numbers during the year:

3 4^{us}: F; 2^{us} Fp P **38** primus terminus 40^e *add.Fp.c.* **77** primus dies saeculi Fp, *Fp.c.* **83** loc.concurr.: K Fp P; *cycilus conc. (4 *Fp.c.*): P, *Fp.c.*; saltus lunae (in *add.Fp*) ultimo anno cycli 19^{lis} *add.Fp P, Fp.c.* **267** hic renovatur indictio Fp P; *om.*K F **334** finit 5^{us} embol. F, *cf.335* **336** inc.p.emb.: Fp F; et est error vicissitudinis *add.F* **365** f.p.e.: Fp P, *Fp.c.*

For the varying series of dates for the entrance of the sun into the zodiacal signs, see §6 and particularly §17.

§15. *Alts* (sub-table of meridian altitude of sun). The values for the meridian altitude of the sun, corresponding to the geographical

latitude of 48°;50 and thus valid for Paris, are the same as those included in the *Kalendarium Reginae* of William of St. Cloud (Harper 1966, 155-80, col.6, cf. William's canon "posui altitudinem solis in meridie in septimo climate", *op.cit.*98. See Zinner 1936,325, and contrast OP p.23). Further, judging merely from the distribution in the manuscripts, this table, like those following, is unlikely to have been present from the beginning of the tradition (cf. Zinner, above).

Manuscripts: R Oc, and some others, of which I have used C. Headings: "Altitudo solis meridiana" C, R(except once); "Altitudo solis in meridie" Oc, R(once). For the figures R was followed except twice, namely, **137** 62°: Oc C; 61 R and **322** 20°: Oc C; 19 R. - Oc and C depart simultaneously from R twice elsewhere, namely, **59** 36°: 35 Oc C and **91** 39': 30 Oc; 29 C. - There are a few unsystematic departures from Harper's edition of William.

The "tabula graduum altitudinis solis et minorum eius in meridie cuiuslibet diei secundum P. de Dacia", which occurs by itself in Ba, 149v, has values as in *Alts* and is no doubt an extract from the Calendar.

Tables with values which may be rounded or truncated from those of *Alts* are in the calendars of Ly, Mj, N; and tables adapted to other latitudes are in Bo,Ca,Ma,Oa, and secondarily in Cj. In Bo, Ca, and Oa, adapted *Qdie*-tables also occur (§16).

§16. *Qdie, Qnoc* (sub-tables of lengths of day and night). Like the table above, these tables are identical to those included in William of St. Cloud's *Kalendarium Reginae* (Harper 1966, 155-80, col.4-5; cf. William's canon "in tertia autem columna est quantitas dierum artificialium mensis in directo cuiuslibet diei collocata. .in quarta vero columna est quantitas noctis illius diei in directo cuius est posita", *op.cit.* 97-8. Cf. Zinner 1936,325; OP p.24).

Manuscripts: R G Oc, and several others. Headings: "Quantitas diei artificialis / Quantitas noctis ipsius" R G Oc. When accepting some secondary corrections in these manuscripts, the tables present few variant readings. R has been followed except at the only place where G Oc go against it together, namely, **141** 26': G Oc: 25' R.

Isolated tables with these values, attributed to Peter, occur twice, namely, as "Quantitas diei artificialis secundum magistrum Petrum de Dacia", in Ba,150r, with values for three dates in each month,

unevenly spaced, mostly corresponding to those of *Qdie*; and as "Tabula quantitatum dierum artificialium in horis et minutis secundum Petrum de Dacia", in Sg,29r, with all the values of *Qdie* (noted by Eneström (1885,3) 25 no. 17; cf. O. Pedersen 1976, 36 no. (9.2)). These are probably both extracted from the Calendar.

Tables of day-lengths for other latitudes are in the calendars of Bo, Ca, Oa, and secondarily in F, cf. descriptions in §2b.

§17a. *Grad* (sub-table for solar longitude). The values in *Grad* correspond to those in William of St.Cloud's *Almanach* for the dates "1296" Jan.-Feb. (=our A.D.1297), and 1296 Mar.-Dec. (=our A.D. 1296). For the dating see also the testimony App.1(a1-2). These values, like other selections of solar longitudes from William's *Almanach* or older sources, often occur elsewhere in the form of separate tables: examples of their contexts can be found in §6, *Introd.* §5b, App.5(g1), and below. Such tables, including *Grad*, have been analysed by R.P.Mercier (see List of References).

Manuscripts: V B G Oc, and some others. - Headings: "Gradus solis" B, V (9 times), G(once), Oc; "Gradus solis in quolibet die" G(4 times); "Gradus solis in quolibet signo (gradu signi V(once))" G(4 times), V(3 times); "Gradus solis omni die" G(twice). - For the values I have followed V unless noted, and further noted all variants in more than one of the manuscripts mentioned.

5 23°: 33 V **12-15** 35'-38': 36-39 BG **64** 22°: 23° *omnes* **74** 50': 40 V **151** 17°: 18 V **159** 46': 47 BG **161** 26°: 24 V **163-4** 35',32': 37,35 G; 35,37 B **197** 0°: 1 V G Oc **218** 13': 12 BG **236** 40': 39 G Oc **338-65** (minute values left out by V: the majority of B G Oc was used) **351-65** 8'--21',22': 7,8--21 G

The values thus determined show three major deviations from the copy of William's *Almanach* in Vat.lat.4572, namely: **64-85**, minute-values mainly one less than *Almanach*, but no systematic slide of column. **182-212** 44',37',--,25',23': *Grad*; 42,39,37--,25 *Almanach*. **299-304** 11',--,11': *Grad*; 12,12,13,13,14,15 *Almanach*.

A copy of *Grad* detached from the Calendar may be seen in the anonymous table in S,21r, accompanying the Calendar, and showing the errors of *Grad* above. The last is also true for a table found together with *Decl* (§18) within the Grosseteste-calendar of Paris St.Geneviève 1043,35r+ (cf.§6), of the early 14th century; since this

witness does not seem to depend on Peter's Calendar in other respects (§2c), it may be safer to assume some common source for the *Grad*-values including the errors. Lastly one should mention the set of tables for 4 years, accompanying Peter's Calendar in K,46v-48r: these show the values of the *Almanach* as against *Grad*, and are adapted to our year-reckoning so as to begin in Jan.1296. They cannot represent a source for *Grad*, since, as was seen, this rests on a table beginning in March.

§17b. *Dates of the sun's entrance into the zodiacal signs* (cf. §14). In the classification attempted below, one or two deviations in single manuscripts are ignored.

The original series was no doubt the old one of (a) *XV Kal.* in each month, left over from the framework of Grosseteste's calendar. Among all the manuscripts examined, this is found in K Sc L Kr, H Cj, T W Oc Sf, O, Wu Mf, A Pl Oa (second hand only), Pr. The entries generally have the form "sol in (sign)", additionally "secundum antiquos" (T W), "secundum Rupertum Linconiensem" (L); TWL have alternative series, cf. below.

The series (b) *12,11,13,12,14,14,15,16,15,15,14,13* is the one given by the *Grad*-table. It is in the manuscripts V L D, Ma Re, Mg, Mt Bv Mk Bs (except for one or two variants somewhere, and several in Mg Bs). For February and March, P Q have these dates as alternatives, and F C as the only ones; further, Sc has one as an alternative in February, and C one in April. The entries generally run "sol in (sign)", "sol intrat/ingreditur (sign)", additionally "secundum Petrum Dacum" (L), "secundum verum motum eius"(Bs).

The series (c) *14,13,16,15,15,14,14,14,13,14,13,14* is in the manuscripts Fp, Or, and preponderant in P Q F C. The entries are "sol in primo gradu (sign)", or just "sol in (sign)" (Fp). I cannot determine the source of this series.

Other less common sets are: (d) *12,11,13,13,14,14,16,16,16,15,13,14*, in T W ("sol intrat (sign) primum gradum") and Y ("sol intrat (sign)", with a set of "sol in primo gradu (sign)" on the subsequent dates); (e) *12,11,13,13,14,14,16,14,15,16,14,14*, in R B ("sol in(trat) (sign)"), corresponding, except for August, to the entries in William's *Kalendarium Reginae*; and (f) *14,12,13,13,14,14,14,14,15,14,13,14* in Mj Ly. The rest of the manuscripts show no entries, or else their series are not comparable to the above or to each other. The set of Ca may, however, be that of C augmented by one.

The series of solar positions at the beginning of each month, quoted in §14, does not fit any of the series above, nor the table within the Old Quadrant (Tannery 1922,164).

§18. *Decl* (sub-table for solar declination). Manuscripts: V G F B Oc, and some others. – Headings: "Declinatio solis" V G F B Oc; "in quolibet gradu" *add.*V(twice); "omni die" *add.*G(3 times); "in quolibet signo/die" *add.*G(twice). – A further copy of the table occurs, alongside with *Grad* (§17a) in the Grosseteste-calendar of Paris St. Geneviève 1043 (§17a), here called Pg. I do not know of any other parallels. As in the case of *Grad*, it may be rash to assume that Pg had its values from a copy of Peter's Calendar.

For the text printed, the consensus of V Oc was followed where possible. I have noted all non-singular variants and an arbitrary choice of others.

32 28': FB; 38 V; 18 G; 34 Oc **52** 37': 36 Oc; 39 G **57-9** 50',20',59': 20,55,16 B **61** 59': 50 FBG **98** 10': 14 FBG **114** 23': 33 Oc; 13 G **119-20** 47',7': 33,31 B **166-81** 33',31'--33': 31--33,32 G Oc **171-2** 24',21': V,Oc(shifted); 21,20 FBG **197** 20°: 19 FB; 10 Pg **202** 48': 45 FB **220** 13°: 14 FBVG; (shifted) Oc **223** 12°: 13 *omnes* **226** 12°: 11 *omnes* (and further inconsistencies in the degree-column, possibly due to shifts both here and in the minute-column) **233** 26': 36 FB **241** 25': 45 FB **251** 57': 22 FB **265** 50': 40 FB **274** 12': 2 V; 0 G **283** 45': 25 FB **291** 40': 30 FB **306** 20': 24 FB **321** 20°: 21 FB **328** 22°: 21 FB **351-2** 29',27': 30,29 FB; 29,29 G **360-1** 22°: 23 G Oc

Apparently G,FB form a group apart. At the points mentioned (except 197), the readings chosen turn out to be those of Pg, which, on the whole, seldom departs from the text printed.

When deleting the entries which are the arithmetical mean between their neighbours and could thus have been found by interpolation, the minute-values remaining show some preponderance of multiples of 10 and 12. At a guess, they might have been read off an astrolabe or some such instrument. In any case the values appear to be independent of those in *Grad*, which seems to exclude William as a possible origin. The source had better be left in doubt.

Manuscript A has a sub-table with the *Decl*-values truncated to degrees. No other variants of the table have been found.

§19. *Dmen*. Manuscripts: K Sc, G H Cj P Q, and others. – Headings: "dies mensis" Sc G H P Q, K(twice); "dies (month)" K(10 times); "numerus dierum" Cj.

Dann. Manuscripts: K Sc, G H P Q, and others. – Headings: "dies anni" K, Sc(4 times), G,H,P,Q(9 times); "dies mundi" Q(3 times); "dies totius (a principio Sc(once)) anni" Sc(8 times).

Both these tables were common in the calendar of Grosseteste and could have been improvised or taken over from some such framework.

§20a. *Other sub-tables of Calendar* (first hands).

Conjunction table from William of St.Cloud's *Kalendarium Reginae*, in Cj Oc Re: see App.5(j2).

At the appropriate places, columns for determining the dates of the five moveable feasts may be introduced, containing golden numbers (P,D,Pe) and/or the 35 possible tabular letters (D,L).

Lunar letters, for use with the lunar tables App.4(e): Bs Kt Pe. Cisiojanus, one syllable for each day, cf. App.5(f1): Bs Kr. For some other late additions see under Ml, Bs, Pd.

§20b. *Other additions to the Calendar*, usually occurring as entries to each month, are generally numerous and disparate, and should be sought in the descriptions §2b or in App.5 and 6. Those in the text-hands of the reference manuscripts are mentioned here.

The manuscripts K R B have no particular additions to the tables as printed here, with the modifications of §10ff.; and F P Q only add the headings "sol in (.) gradu (sign)" (§14).

The entries "nox habet horas (.), dies (.)" for each month, with the day-lengths 8,10,12,14,16,18,16,14,12,10,8,6, are in V, Sc(Feb.-May), Fp(Jan.-Mar., secondary), and are frequent elsewhere. They may have been introduced from any calendar current. An attribution "secundum Petrum Dacum", in L, may be explained by the assumption that L used an ascribed copy of the Calendar in addition to another source: for a parallel see §17b(a-b).

A table "Quantitas crepusculi" with two values for each month, labelled "in principio huius mensis" and "in medio huius mensis", is in G, R(Jan., secondary), and in L Oc Re Oa Bs. The values of Oc are 2^h;2 2^h;0 / 1;56 1;54 / 1;52 1;53 / 2;2 2;11 / 2;31 2;55 / 3;47 4;0 / 3;32 2;53 / 2;24 2;8 / 1;56 1;52 / 1;52 1;53 / 1;56 2;0 / 2;4 2;6. The values of G are the same but for several scribal errors. – The table, and the values except for two deviations of 1', are those of William's *Kal.reginae* (Harper 1962,155+, mentioned in William's canon, *op.cit.* 99-100).

Some computistical information, at the top of a page or heading the column *Comp*, occurs as follows: (January, H V Fp:) "Hic

renova(n)tur littera dominicalis, aureus numerus et claves terminorum". (March, H V): "Hic incipiunt regulares solares et concurrentes". (September, V): "Hic incipiunt epacta et regular.lunar."; (H:) "Hic incipiunt regulares lunares et epactae et embol. etc." – Differently arranged, in Fp to January and in V to February, one has "Primus annus Christi incept in die Sabbati; primus annus Arabum incept in die Iovis(om.V); primus annus Graecorum incept in die lunae".

Other additions occur in plenty in the later manuscripts. Since, as was seen, the reference manuscripts either have well-defined and common additions or lack them altogether, no reason was found to adopt any of them in the text printed.

§21-22. *T.L.* "Tabula Petri Daci de loco lunae inveniendo. . ."

§21. *T.L.* in the reference manuscripts. Considering only the reference manuscripts, *T.L.* is found in V, G F R B P Q, Fp(secondarily). Comments on its occurrence and its coherence with the Calendar can be found in §6.

Headings: as printed: V F R B P Q Oc, and G(om."a media-incepto"); "Tabula magistri Petri de Dacia ad sciendum in quo signo sit luna et(!) quolibet die anni a media nocte sui incepto" Fp. – Sub-headings: "aetas lunae / gradus lunae (om. F; signi Q)": F R B Q; "dies perfecti aetatis (aetas Fp) lunae / gradus signi in quo est luna" Fp P Oc; "aetas lunae / <> in quo est luna" G; "dies / gradus ad initium signi" V.

A row of month-names March--February is added by G (above heading) and by Fp Oc (above first row of signs). This is not presupposed by the canon and must have been taken over from the old lunar table (see below). In the first row of the body of V's table, a second hand has added short notes on the properties of the signs.

The orientation of the sign-names in the body of the table printed is as in GFRBPQ. In Oc the upper left "aries" and its analogues have been given a half turn; in Fp, the names in odd columns have been written ↘ and those in even columns ↙, all standing on the diagonal; the same holds for V, but the directions are ↗↘.

For the origin of the table, an easy guess is the old 12 × 12 *Tabula lunae*, common in our period (see App.4(a)). The right column of degree-values may have been taken from a contemporary one-dimensional lunar table (App.4(c)), which happens to occur in ms.N

appended to the Calendar. A different value for the lunar velocity is shown by the table in William of St.Cloud's calendar (App.4(d)).

§22. The details of the *T.L.* vary much in the remaining manuscripts. The following only presents some salient features, to be found in more detail in §2a and §2b.

A common alternative heading is some variant of "Tabula magistri Petri de Dacia (dicti Philomena *add.* Lp Ma P3) ad sciendum in quo signo sit luna (l.s. qualibet die Lp) et in quo gradu illius (*om.* Lp) signi (*om.* Ma)": A Mj O4 E7, Lp, Ma, P3, O5, La, Om; "Tabula magistri Petri de Dacia dicti Philomena" C, M M8 So(142v). Significant similarities are also shown by Bv Mk So(56v); Ba Pc; L S Ro; Pr(24v) Pe; Le Ow. The label "Tabula medicorum", in some context, is found in Ro, Pl, E2, L. This may be traditional: see, e.g., App.4(a2) note 2, and cf. *Intr.*, note 11. The commonest sub-headings to the left and right columns are still "Aetas lunae / Gradus lunae".

The upper row of month-names (§21) is a common feature. See App.4(a) for some further instances of mixture with the 12 × 12 lunar table.

The right column, of degrees, often has the form "13,26, . . ., 5", or 1 degree less than normal. For parallels one has the *Computus Orbicularis*, cf. App.4(d), and the statement "Computus Cy(rome-tralis) habet sic" of Kh, 151r. This set of values is shown by Bv Mk So(56v) Bs, Pr(I^r and 24v) Pe, X, Ml, all of which are anonymous but accompany the Calendar; by Wi, Bx, Pf, Vp, which have ascriptions in a heading or canon; and by Kh Md Pn.

A specifically English group seems to consist of the lunar tables where, using the symbols of §2a, the right column shows (c) degrees and minutes, mostly beginning with 13°10'; or where (d) it is split up into about 11 columns; the first of these mostly has the degree-values "13,26, . . .", which are then incremented by 3° in each succeeding column, turning from 30° to 1°. Degree-values belonging to different signs may be separated by red lines, cf. the canon App.3(g). None of all these tables have ascriptions to Peter except that of Lo. Their contexts are as follows: *Calendar of Elvedene* and astrology: Lo(c), ascribed to Peter and with the canon App.3(a1) much resembling the *T.L.* canon. *Tables of Will. Reed*, or astrology: Le(d); Ow(d); Od, 53r(c, 13 rows and columns), all with the canon App.3(a2) not unlike Peter's. *Calendar of Nicholas of Lynn*: Lr(c); Ln(c), both with 13 rows, no canons. *Calendar of John Somer*: Pr, 22r(d, also a normal right col.); Ny(c+d), both of them with the canon App.3(g), and Ny also with App.3(c1) which accompanies the Calendar

elsewhere (in Pe). *Other contexts*: Od,7r-v(?garbled), with the canon just mentioned, and astrology like Lo. Further, Ew(c+d), in no determinable context; Mz(c), to a German calendar App.5(j9), with canon App.3(f); B, in a later addition (c); and Par.lat.11252(c, French: §2b). A further English example of type (d) is shown by Bober 1948, Plate 11*d* and p.26 n.6, from the folding-out calendar London B.L. Sloane 2250, where it is accompanied by a sign-man with the canon App.6(d8). The connexion of all these lunar tables with the *Calendar* or *T.L.* is, on the whole, indicated in several ways, but clearly they constitute one or a few isolated groups, so that neither their form and context, nor specifically the other ascriptions (App.6(b)) carried by Lo, should give rise to inferences about the textual history of the authentic *T.L.*

 est annus instans in primo cyclo totus (H Sa:) litteram totam in ordine alphabeti quaeras in linea prima descendente; et si a 19 et in 39, minus tamen 39, est annus instans in
 10 secundo cyclo totus quantum residuum, demptis 19; si autem fuerit plus 38, minus autem 58, abiectis 38 residuum ostendet, in quoto anno sis cycli
 tertii; si vero plus fuerit 57, minus
 15 tamen quam 77, ultimus cyclo erit et annus eiusdem totus quantum residuum, demptis 57. – Si autem ex abrupto scire volueris, in quoto anno
 quoti cycli fueris, sine divisione, pro
 20 prima revolutione kalendarum scias istos versus: 'Mille minus cum ducentis nonaginta duobus Ex annis domini quaeratur littera cycli'. Ab annis igitur domini demas 1292, et residuum dabit
 25 tibi annum, cum quo invenies litteram primationis. – Quotuscumque igitur quoticumque cycli fuerit annus, litteram in ordine alphabeti totam quaeras, et haec erit littera primationis anni
 30 praesentis vel ut praesentis.

Quacumque igitur littera primationis inventa, scias per totum annum, cui deservit, lunam primam esse die e directo eius ascripto, et a media nocte praecedente ipsum hora tota, quotus [seu quantus] est numerus litterae inventae subscriptus; immo in horae ultimae
 35 quarta tota, quotum angulum cellae litterae punctus occupat, a sinistro qui sursum est per dextram computando. Si etiam duo puncta in eadem cella inveniuntur, rubeum posteriori litterae attinebit. Quando etiam duo puncta in eundem angulum in ipsa compositione ceciderunt, per angulum bipertitum designavi. Si etiam nullum punctum
 40 inveneris, in complemento horae ascriptae luna soli coniungetur.

(*H Sa.*) Nec bissextus aliquam immutationem in perpetuum inducet, sed semper luna primabitur ubi primatio est ascripta.

Transactis autem 76 annis, quod erit anno domini 1369, demantur de horis 6, et puncta ad proximos angulos in antea situentur, et
 45 current primationes sicut prius.

(*H Sa Sb, def. Y.*) Et nota quod si vitium scriptoris devitare volueris, litterarum ordinem hunc habeto, quia octava in ordine alphabeti ab assumpta eam sequetur.

(*K H Sa, Y.*) Si etiam ipsum de novo componere volueris, per tabulas
 50 meas coniunctionum supra Parisius primam coniunctionem anni domini 1369ⁱ quaeras,

(*H Sa Y.*) et invenies eam 8^o die Ianuarii, 21^a hora, et 6^o minuto illius horae. 'A' igitur scribas in
 55 prima linea descendente e directo 8ⁱ diei Ianuarii, et sub ipso 21, et punctum in primo angulo superiori versus sinistram. Deinde supra 8 dies addas 29, et supra
 60 horas 12, et supra minuta 44 et 3 secunda, et ab aggregato tollas dies mensis Ianuarii, scilicet 31, et remanebunt 7 in diebus, 9 in horis et 50 in minutis et nihil in
 65 secundis.

(*K:*) et eam invenies 8^o die Ianuarii, 22^a hora, lapsis 6 minutis. Scribas igitur 'A' e directo 8ⁱ diei, et sub eo 22, et punctum in angulo superiori versus sinistram. Deinde, scriptis 8 diebus 21 horis et 6 minutis in pulvere, eis subscribas tempus lunationis, scilicet 29 dies 12 horas 44 minuta et 3 secunda, quod sufficit, et primis addas, quodlibet alteri sui generis, et ab aggregato tollas dies Ianuarii, et remanebunt 7 in diebus, 9 in horis et 50 in minutis.

(*H Sa Y:*) Scribas igitur 'A' e directo 7ⁱ diei Februarii, et sub eo 9, et punctum in sinistro angulo inferiori. Semper igitur supra residuum addas sicut primo, et ab aggregato tollas dies mensis, in quo ultimo nunc scripsisti; caveas etiam, ut in anno bissextili pro diebus
 70 Februarii tollas 29. Et sic per omnes menses anni primi scribas A, sic in secundo B, et sic deinceps usque ad T, et tunc iterum A et B et cetera in secunda linea, et sic quousque 4 cycli compleantur, scilicet anno domini 1444°.

Ad locum etiam lunae habendum videas quota est dies coniunctionis ab ingressu signi, in quo est; et in toto gradu eiusdem signi sol et luna coniungentur, et ita habebis locum lunae ad diem coniunctionis. Quod si locum eius ad quemcumque alium diem quaesieris,
 5 cum numero dierum a die coniunctionis perfectorum in tabulam meam de loco lunae inveniundo intres, et e directo eius sub signo coniunctionis descendens in angulo communi signum invenies, in quo erit luna; et in quoto eiusdem signi gradu fuerit, numerus graduum versus dextram stantium e directo numeri dierum vel signi
 10 hoc ostendet. Et hoc verum est, si coniunctio in primo gradu signi fuerit cuiuscumque; sin autem, supra numerum graduum iam inventorum numerum graduum signi coniunctionis perfectorum addas; et aggregatum si 30 vel minus fuerit, in tali gradu signi inventi erit luna; si autem aggregatum plus 30 fuerit, abiectis 30 residuum ostendet in
 15 quoto gradu signi sequentis erit luna, die quaesito, hora consimili horae coniunctionis, a media nocte die incepta. Si etiam locum eius pro qualibet alia hora eiusdem diei volueris, pro duabus horis gradum computabis. Locum autem lunae voco locum centri epicycli lunae.

In ista parva tabula sunt
quattuor cycli sive li-
neae ad sciendum quae
littera est primationum
5 lunae, et hoc per annos
domini.

CANON SUPRA KALENDARIUM MAGISTRI PETRI DE DACIA.

Quaere inter numeros in superiori parte
istius tabulae positos unum numerum ex
illis, qui maxime similis est annis domini,
et sit minor quam anni domini. Si forte
annos domini complete non inveneris ibi,
tunc illum numerum, qui forsitan minor
est annis domini, comple et fac eum
aequalem annis domini, scilicet compu-
tando a sursum usque ad deorsum; et
littera illa de litteris huius tabulae, quae
perfecerit annos domini, primationis erit.
Et si praecise inveneris annos domini,
tunc littera ultima lineae praecedentis ver-
sus sinistram erit littera primationis illius
anni.

[Verbi gratia, esto quod anni domini
sint 1311: eos invenies in capite secundae
lineae versus dextram computando a sini-
stra, et ideo littera ultima lineae primae,
scilicet T, erit littera primationis lunae
illius anni. - [Sed quando anni domini
erunt in prima linea, scilicet 1368 vel 1444
vel 1520 vel 1596, tunc littera ultima li-
neae quartae, scilicet T, erit littera prima-
tionis lunae illius anni.]]

Quaecumque igitur littera primationis
inventae, scias in quo cyclo est vel in qua
linea, et tunc quaeras eam in tali cyclo
kalendarii.

Et sciendum quod ubicumque invenitur
littera primationis deserviens illi anno, de

quo quaeris primationem, in tali die luna primatur, et numerus
35 subscriptus horam primationis ipsius ostendit; et in tali quarta horae,
qualem angulum punctus occupat, computando ab angulo superiori
sinistro. Nam si punctus primum angulum occupat, scilicet in
superiori sinistrae, tunc luna primatur in prima parte; si secundum
angulum occupat, scilicet in superiori dextrae, tunc primatur in
40 secunda parte; si tertium angulum occupat, scilicet in inferiori
dextrae, tunc primatur in tertia parte; et si est in quarto, scilicet in
inferiori sinistrae, tunc primatur in quarta parte horae ascriptae. Si
autem duo puncta in eadem cellula inveniuntur, rubeum posteriori
litterae attinebit. Si autem nullum punctum inveneris, in comple-
45 mento horae ascriptae luna soli coniungetur. Et sciendum est quod
dies et horae incipiunt in media nocte praecedente.

Appendices

Appendix 1. Texts concerning sub-tables of Calendar. Canon to calendar of Grosseteste.

Variant canons to Peter's Calendar have been registered in App.2. Notes on up-dating the Calendar, or on finding conjunctions generally, are also in Pe,24v and Pd,38r-v.

(a1) Canon to the tables *Grad* and *Decl* in the Calendar. Manuscripts: Y, 296rb; and Fp, 96r, in a secondary supplement to the ms.; the Calendar of Fp (first hand) does not contain the tables in question. See description of Fp for a heading, and §17 for the provenance of *Grad*.

Nota quod per hoc (hunc Fp) kalendarium poteris scire locum solis in nona sphaera e directo cuiuslibet diei, et hoc ad meridiem ipsius (*om.Fp*), et declinationem solis e directo cuiuslibet gradus. Est autem haec aequatio solis (*om.Fp*) facta ad primum annum post bissextum, scilicet anno domini 1296 (1297 Fp). Igitur si scire volueris (si sc.v.: sc.si si v. Y; si v.habere Fp) ad secundum annum post bissextum, scias quod locus solis repertus ad meridiem (a.m.: nunc Fp) anticipabitur per 6 horas, et in tertio anno post bissextum per 12, et in quarto (4 Y) per 18 (8 Y), qui quartus est bissextilis; unde in primo (secundo Y) anno post bissextum prior aequatio revertetur, nisi quod sibi addatur motus octavae sphaerae in quolibet anno. – Et ut habeas altitudinem solis meridianam in qualibet regione (m-am i.q.r.: i.r.q.m-a Y), scias altitudinem arietis in regione illa (i.r. Fp), cui, si sol fuerit in signis septentrionalibus, declinatio est addenda, (et *add.Fp*) si in (*om.Y*) meridionalibus, subtrahenda (explicit *add.Fp*).

(a2) Same subject. Manuscript: Lh, 217v, in a secondary addition to the T.L.canon.

Scias quod gradus solis in kalendario fuit aequatus ad primum annum post bissextum, scilicet anno domini m^occ^ononagesimo sexto, in meridie. In secundo anno tunc anticipat(ur) per 6 horas et in tertio per 12 et in quarto per 18, qui quartus bissextilis est; et tunc revertitur prior aequatio, nisi quod in quolibet anno addatur motus octavae sphaerae, qui est unum minutum in anno. Elevatio arietis Brugis est 38 graduum, et motus octavae sphaerae in anno 1296^o fuit 10 gr. 17 mi.

(b) On doubly occupied cells in *Cycl*, and canons to *Decl* and *Qdie*. Manuscript: F, in a scribe's note at 233v-234r, apparently meant to continue Kal.canon B. The Calendar of F correctly shows a doubly occupied cell at Aug.29, left out in the list below; the table *Qdie* is for Naples, in the same hand as the present note.

Si autem duae litterae in una cellula erunt, tunc in eadem cellula possunt esse duae lunationes. Si vero in ea erunt duo puncta, punctus niger correspondet litterae rubeae, et si punctus fuerit rubeus, correspondet litterae nigrae. Simili modo intellegendum est de hora.

Et est sciendum quod, quando duae lunationes sunt in una cellula, tunc est necessarium ut sint in diversis temporibus, scilicet quando una litterarum erit ostendens coniunctionem, tunc erit in illo tempore, et quando alia littera ostendet coniunctionem, erit similiter in illo tempore. - In kalendario sunt septem menses, in quibus sunt cellulae cum duabus litteris, et sunt in locis 14 in diversis cyclis, ut inferius in tabula patet:

Menses	Loca	Die	Cycli
Frebur.(!)	2	19 25	3 4
Martius	1	8	2
Aprilis	4	11 19 22 25	2 3 1
Maius	2	3 6	1 2
Iunius	2	17 20	1 2
Iulius	2	1 4	1 2
Augustus	1(!)	15 <29>	1

Sunt 14 loca.

Si scire desideras quanta sit declinatio solis in quolibet die anni, et etiam quot horas habeat quilibet dies anni, scilicet de horis aequalibus, intra in kalendario cum illa die quam vis, et in directo illius diei <quod invenies> in linea transversali sub titulo "Declinatio solis" de gradibus et minutis, tanta erit declinatio solis in illa die, id est quantum sol distat ab aequinoctiali. Et sub titulo horarum et minorum in illo directo invenies quot horas illa dies habet.

(c1) Jo. de Palmis, on his revision of *Cycl*, making it valid for the years 1369-1444. Manuscript: So,45v, note in text-hand appended to Kal. canon B(h).

Notandum igitur quod cum, anno domini 1368 completo, revoluti sint anni 76 ab anno compositionis istius kalendarii, et per consequens quaelibet lunatio de cetero falleret in 6 horis si non corrigerentur, idcirco ego Johannes de Palmis, huiusmodi fallaciam volens praevenire, correctioni et emendationi

ipsius kalendarii cum diligentia qua potui institi, non cum propria industria, cum ad hoc paucitas mei ingenii non sufficiat, sed iuxta doctrinam traditam a reverendo magistro Petro de Dacia, huius kalendarii ut fertur compositor: a qualibet lunatione in calendario reperta 6 horas subtraxi, et punctum quemlibet repertum in angulum anteriorem proximum situavi, per quam subtractionem et punctorum anteriorationem verificatae sunt lunationes ipsius kalendarii iterum pro annis 76 incipientibus ab anno domini 1369, quibus elapsis, qui tunc in humanis degat, correctioni ulteriori similiter faciendo si placet insistat.

(c2) Same subject, anonymous. Manuscript: Bs, solitary note at f.2v and again at f.6r, with insignificant variants; I reproduce the latter version.

Notandum est quod magister Petrus de Dacia fecit tabulam sequentem anno domini 1292 de coniunctione solis et lunae; et ab illo tempore semper elapsis 76 annis demi debent 6 horae a qualibet coniunctione, et puncta inventa in angulis ad proximos angulos in antea situari debent, et sic coniunctiones possunt perpetuari. Una ergo revolutio 76 annorum completa fuerat 1368 (f.2v; 1360 *hic*), et tunc coniunctiones correctae fuerant ad aliam revolutionem, in qua nunc sumus, quae terminabitur anno domini 1444.

(d) T&K 55: canon to the calendar of Grosseteste. The present text reproduces Cj,4r. It thus includes some secondary revisions, by the scribe himself or at least in a contemporary hand, applied in order to adapt this canon to the calendars of Peter Philomena and of William of St.Cloud. The secondary parts are printed in italics, and in [] if written over erasure. The text is essentially that printed by Lindhagen 1916-7 p.15-16, from Stockholm K.B., X 767, where it ends at "... civitatis volueris" and is followed by a lengthy marginal gloss.

(Hdg. :) Canon super 4 cyclis verae primationis lunae. (Txt:) Ad notitiam huius kalendarii habendam, sciendum quod 19 litterae alphabeti secundum ordinem in 4 lineis pro aureo numero ponuntur, ita quod A pro unitate, B pro binario, C pro ternario, et sic deinde. Et deserviunt hae 4 lineae quattuor cyclis decemnonalibus, ita quod prima linea primo cyclo, secunda secundo, et sic deinceps. – Unde, ad habendum primationem veram alicuius lunationis secundum astronomos, scito, in quoto cyclo horum quattuor cyclorum sis et in quoto anno eius, sic: annis [*domini perfectis adde annum imperfectum et*] totum collectum divide per 76. Et si remanserit 19 vel minor numerus, sumus in prima linea, et in totali anno illius cycli quantum fuerit residuum. Si vero remanserit plus quam 19 et minus quam 38, sumus in secunda linea, et in toto illius cycli anno quanto plus fuerit quam 19. Si autem plus quam 38 et

minus quam 57 remanserint, sumus in tertia linea, et in toto anno cycli illius quantum plus fuerit 38 (34 Cj). Si autem remanserint plus quam 57 et minus quam 76, sumus in 4. linea, et in toto illius cycli anno quanto plus est quam 57. – [[Hoc etiam est notandum quod, secundum institutionem huius auctoris, oportet semper addere ad residuum annorum domini a principio Septembris usque ad nativitatem domini unitatem, quia littera designans aureum numerum semper renovatur in Septembri.]] – Et sciendum quod, ubicumque invenitur littera deserviens illi anno de quo quaeris primationem, in tali die primatur luna; et numerus litterae subscriptus horam primationis ipsius ostendit. (Rubric:) Explicit capitulum. – (Txt:) Et notandum quod tam dies quam horae primationis lunae in quattuor cyclis huius kalendarii fiunt secundum mediam coniunctionem luminarium super meridiem Parisius, ut credo: unde, si diem et numerum horae primationis lunae verificare volueris, hoc facere poteris intrando tabulas coniunctionis solis et lunae, tam in annis collectis quam in annis expansis, et in mensibus si oporteat, et adaptando horas primationis longitudini cuiuscumque civitatis volueris. – Et nota quod, elapsis quibuslibet 76 annis, demantur 5 horae et 48 minuta, et habebis semper propositum.

Et si ex abrupto scire volueris, in quoto cyclo et quoto anno cuiuscumque cycli fueris, saltem pro prima revolutione kalendarii, ab annis domini, pro quibus quaeris primationem, remove 1292, et residuum ostendet propositum absque omni calculatione. Unde versus:

Mille minus cum ducentis nonaginta duobus

Ex annis domini quaeratur littera cycli.

Notandum praeterea quod in quolibet mense in hoc kalendario in duabus primis lineis apponuntur litterae primationum cum numero horarum primationis secundum magistrum Guillelmum de Sancto (?)clado, et incepit ab anno 1292º, cui deservit A.

Appendix 2. Variant canons to Calendar.

These are mostly recognizable as adaptations of Kal.canon B: thus, the group-names (d)-(l) below continue those used in *Pref.* §8 for the classes of witnesses to the standard text.

Synopsis:

- (d1)** L,2v; Mf,7v. **(d2)** Mg,163v+170r-v. **(d3)** Wu,1r-2r(fragment).
 Nearest to Class (a) of the standard text.
- (e)** N,69v. Almost collatable with Class (a).
- (f1)** X,2r. **(f2)** Oa,151r-v.
 Possibly unrelated. One insertion in Oa may be from Class (h1).
- (g)** O,1v; Md,72r; St,24r.
 Nearest to Class (b) and especially to ms. M.
- (h1)** Pr,34v; Bo,167v; Pe,25r-v. (Mt p.232; Sf,1r.)
 Pr Bo Pe resemble Class (b), with the addition of a passage also found in Mt Sf (and cf. (f2) and *Pref.*, end of §7a). The main texts of Mt Sf are standard.
- (h2)** Bv,10v; Mk,1v; So,45r. Quite close to (h1). **(h3)** Bs,12v.
- (j1)** N,69vb; D,13r-v. **(j2)** Re,1r. **(j3)** Ro,63v-64v.
 Nearest to Class (b), especially (j2-3), which are in French.
- (k)** Kt,1r. In French; some of the wording close to standard.
- (l1)** Pd,56v+58r. **(l2)** Da,173v.
 Possibly unrelated, and connexions dubious.

Further canons occur singly in Bs,12v (from William of St.Cloud?); Oa,151r; and V,61r (table, relation to Calendar dubious).

(d1) Manuscripts: L,2v; Mf,7v. L is followed in the common passages.

(L:) (Letter table with the years 1292-1653 above the table and 1672-2033 below. Hdg.:) Hii sunt quattuor cycli ad sciendum quae sit littera tabularis primationis lunae omni anno.

(Mf:) (Letter table 1292-1577 (written 1477). Below the year-numbers:) Hii sunt cycli ad sciendum quae sit littera tabularis.

(L,Mf:) Quare inter numeros annorum domini in superiori parte istius tabulae positis unum numerum in quacumque linea, qui maxime accedit¹ in quantitate ad annos incarnationis² domini, quod tamen ille sit minor³ annis domini; et tunc fac ipsum⁴ aequalem annis domini, a sursum usque deorsum

computando in alphabeto sibi supposito⁵; et littera illa⁶, quae compleverit annos domini, erit littera primationis lunae istius anni⁷ in quolibet mense⁸. Et si forte complete⁹ inveneris annos domini⁹, tunc ultima littera lineae praecedentis¹⁰ versus sinistram est littera primationis lunae. Verbi gratia, esto quod anni domini sint mcccxi; ipsos invenies in capite secundae lineae; tunc ultima littera lineae primae, scilicet T, erit¹¹ littera primationis illius anni. Sed quando anni domini erunt in prima linea, scilicet¹² mcccclxviii vel mcccclxiiii etc.¹³, tunc T¹⁴ quartae lineae erit littera primationis. – Quaecumque¹⁵ ergo littera primationis inventa fuerit¹⁶, considera in qua linea sit, et quaeras eam in eadem linea in calendario¹⁷ ante mensem, cuius primationem quaeris¹⁸. Et sciendum quod¹⁹, ubicumque invenitur talis littera primationis, in tali die luna primatur vel²⁰ incenditur in caelo, et numerus subscriptus horam primationis ostendit; et punctus in cancello²¹ positus partem horae, in qua incenditur²², repraesentat. Nam si punctus angulum superiorem sinistrum occupaverit, luna primatur in prima parte horae subscriptae;

(L:) si secundum angulum superiorem dextrum, in secunda parte horae; si tertium angulum dextrum inferius, in tertia parte horae; si quartum angulum, in ultima quarta parte horae incenditur. Si autem nullum inveneris, scias quod in complemento horae subscriptae incendatur.

(L,Mf:) Et sciendum quod dies et horae incipiunt²³ in media nocte diei praeteritae; verbi gratia, dies dominica in media nocte ipsius²⁴ sabbati inchoatur.

(L:) Et cum anni domini suprascripti secundum omnes cyclos suos finiuntur, recurrendum est ad annos domini subscriptos, quia ipsi ulterius docent tabulares litteras invenire.

(Mf:) si secundum angulum superiorem dextrum occupaverit, incenditur in secunda parte horae; si in tertio, in tertia parte horae incenditur; in quarto vero angulo punctus positus, scilicet in inferiori sinistro, quartam partem horae ostendit. Si autem nullus punctus ibi inveniatur, tunc in toto complemento horae sub ultima parte incenditur.

(Mf:) Et cum anni domini secundum omnes praedictos cyclos finiuntur, recurrendum est ad numerum 19^{lem} qui deservit cyclo lunari, et per multiplicationem illius numeri xix^{lis}²⁵ fingentur cycli sequentes.

(d2) Manuscript: Mg,163v and 170r-v. Paraphrase of a text like the version of ms.L above, somewhat extended. Excerpts:

(f.163v:) (Letter table with the years 1292-1653 above the table and 1672-2024 below. No hdg.) - (f.170r-v:) *Quaere inter numeros annorum domini in superiori parte tabulae antesciptae unum numerum, in quacumque linea fuerit, qui maxime appropinquet annis ab incarnatione domini, dummodo ille sit minor annis domini; si forte annos domini complete <non> inveneris, sed forsitan est minor <annis> domini, fac ipsum aequalem annis domini, scilicet deorsum computando, sic scilicet A B C; et littera illa de litteris eiusdem tabulae, quae perficit annos domini, erit littera imprimationis lunae in quolibet mense. Et si praecise vel complete inveneris annos domini, tunc ultima littera lineae praecedentis versus sinistram erit littera imprimationis lunae illius anni in quolibet mense. Verbi gratia, esto quod anni sint mille tricenti et quadraginta novem: ipsos invenies in summa linea versus dextram, computando A B C, tunc D erit littera imprimationis anni quinquagesimi tertii. .ut dies dominica in media nocte sabbati inchoatur. Sed cum anni superius scripti finiantur secundum omnes cyclos, recurrendum est ad annos inferius notatos, qui ulterius docent invenire incensionem et litteras tabulares.*

(d3) Manuscript: Wu,1r-2r. Only the end of the canon is preserved.

(1r:) *Et sciendum quod dies et horae incipiunt in media nocte diei praeteritae. Verbi gratia, dies dominica in media nocte ipsius sabbati inchoatur et in sequentis noctis medio terminatur, et sic de aliis etc.* (1v-2r: Letter table 1292-1729.)

(e) Manuscript: N,69va-b. To a Letter table, 1292(filled in with "1672")-1653. Continued by the canon (j1) below.

(Hdg.): *Sequitur canon seu expositio calendarii.* (Txt:) *Quaere igitur in numero in superiori parte istius tabulae subsequenti<s> posito unum numerum ex illis, qui maxime est simul annis domini, et minor sit (m.s.: m(od)o p(ost) N) quam anni domini; si forsitan ibi annos domini complete non inveneris, tunc illum numerum, qui minor est annis, comple computando a sursum usque ad deorsum, et illa littera de litteris huius tabulae sequenti<s>, quae perficit annos domini, erit littera primationis per totum annum. Et si praecise inveneris annos domini, tunc littera ultima lineae praecedentis versus sinistram erit littera primationis illius anni. Verbi gratia, esto quod anni domini sint 1311: ipsos invenies in capite secundae lineae versus sinistram, et ideo ultima littera lineae primae, scilicet T, erit littera primationis lunae. Sed quando anni domini erunt in prima linea, scilicet 1368 (-64 N) [vel 1539] vel 1444 vel 1520 (1539 N) vel 1596, tunc littera ultima lineae quartae, scilicet T, erit littera primationis illius anni. - Inventa igitur littera primationis, scias in qua iii^{or} linearum istius tabulae est, quoniam in tali cyclo et in tali linea calendarii eam quaeres. Et ubicumque invenitur littera primationis deserviens illi anno, de quo quaeris primationem, in tali die luna primatur, et numerus*

scriptus notat primationis horam; et in tali parte horae, qualem occupat punctus angulum. Nam si punctus sit in superiori angulo sinistrae, tunc luna primatur in prima parte illius horae ascriptae; si superiorem dextrae, tunc in secunda parte; si tertium in inferiori dextrae, in tertia parte horae; si occupat quartum, tunc in quarta parte horae primatur. Si autem duo puncta in eadem cellula inveniuntur, rubeum posteriori litterae atinebit, id est, erit litterae posterioris. Si autem nullum punctum inveneris, in complemento <horae> ascriptae luna soli coniungatur. Dies autem et horae incipiunt in media nocte praecedente quantum ad istum kalendarium exercendum. Mille que ter centum dant simul octo.

(f1) Manuscript: X,2r.

(Hdg.): Hic incipit canon super kalendarium. (Txt:) Quaere in superiori parte istius tabulae numerum annorum domini, et si praecise non inveneris, accipe minorem propinquiorem, et comple eum et fac aequalem annis domini, scilicet computando a superiori ad inferius; et littera illa de litteris illius tabulae, quae perfecit annos domini, littera primationis erit illius anni. Et si praecise inveneris annos domini, tunc littera ultima lineae praecedentis versus sinistram erit littera primationis illius anni. Sed quando anni erunt in prima linea, tunc littera ultima lineae quartae, scilicet T, erit littera primationis. – Quaecumque igitur littera primationis inventa, scias in qua linea tabulae praedictae est, et quaeras in tali linea kalendarii. Et sciendum quod, ubicumque invenitur littera primationis deserviens illi anno, in tali die luna primatur, et numerus subscriptus horam primationis ostendit; et tali quarta horae, qualem punctus angulum occupat, computando ab angulo superiori sinistro. Nam si punctus primum angulum occupat, scilicet superioris sinistrae, tunc luna primatur in prima parte illius horae ascriptae; si secundum angulum occupat, scilicet superioris dextrae, tunc primatur in secunda parte; si tertium angulum occupat, scilicet inferioris dextrae, tunc primatur in tertia parte; «et si fuerit in quarto, scilicet» inferioris sinistrae, tunc primatur in quarta parte horae subscriptae. Si autem duo puncta in eadem cellula inveneris, rubeum punctum posteriori litterae pertinebit. Si autem nullum punctum inveneris, in complemento horae subscriptae luna primatur. Et sciendum quod dies et horae incipiunt a media nocte praecedente diem, et anni domini renovantur in Ianuario, et littera primationis, secundum hoc opus. (Letter table, 1292-1653(or possibly 1729; a later hand has emended the year-numbers and continued them until 1805). Title:) Haec est tabula per quam scitur littera coniunctionis.

(f2) Manuscript: Oa,151r-v. Italics denote secondary hands, all of which may be contemporary with the text-hand. One of these has furnished interlinear supplements and corrections, which are printed

in [] if written in or above erasures where the original text is no longer legible; all notes by this hand are faint, and the readings approximate. A set of marginal additions, by another secondary hand, are marked (Mg.:). Tentative supplements, at places where the leaf has been damaged, have been put into < >.

(Letter table 1292-1653, no hdg.) (Txt:) *Quaere inter numeros in superiori parte huius tabulae positos numerum minorem propinquiorem annis domini. Si forte annos domini non complete inveneris ibi, tunc illum numerum comple et fac aequalem annis domini, computando scilicet per litteras tabulae, descendendo a sursum usque deorsum; et littera, quae perfecerit annos domini ab incarnatione, erit littera primationis «?». Et si praecise inveneris annos domini inter numeros, tunc ultima littera lineae praecedentis versus sinistram erit littera primationis illius anni. Sed quando anni domini praecise erunt in prima linea, tunc ultima littera lineae quartae, videlicet T, erit littera primationis illius anni. - Quacumque igitur littera primationis inventa, scias in quo cyclo vel linea sit, et tunc quaeras eam in tali cyclo kalendarii. In [[illo]] namque die, in quo litteram primationis deservientem illi anno inveneris, luna primat[[ionum]]-ur hora tota, quotus est numerus litterae inventae subscript[[ae]]-us, et in tali [[immo in horae ultimae]] quarta parte horae qualem [[tota quotum]] angulum cellae litterae punctu[[m]]-s occupat, a sinistro, qui sursum est, per dexteram computando. - (Mg.:) <Et punctus,> qui primum angulum in superiori parte a sinistro occupat, ostendit quod luna primatur <in prima qua>rta parte horae; punctus vero, qui secundum angulum a dextro in superiori parte occupat, ostendit quod primatur in secunda quarta parte horae; punctus autem, qui tertium angulum inferiori dextrae(!) occupat, ostendit quod primatur in tertia parte horae; punctus insuper, qui quartum angulum inferiori sinistrae occupat, ostendit quod primatur in 4^a parte horae ascriptae eo die. - Si [[autem]] duo puncta in eadem cella [[vel angulo]] inveniantur, rubeum posteriori litterae atinebit. Si autem nullum punctum inveneris, in complemento horae ascriptae luna soli coniungetur. - (Mg.:) *Item scias quod luna dicitur esse prima sequenti die, scilicet coniunctionem, et in hora consimili qua fuit coniunctio, quas horas computabis a media nocte, post quam incipiunt dies secundum ecclesiam; et quod horae sunt semper aequales omni tempore anni. - Transactis autem 76 annis «. anno. 1369» demantur de horis sex horae, et puncta ad proximos angulos in antea situentur, et occurrent coniunctiones sicut prius. Et semper pro 76 annis elapsis ab anno domini 1292 a coniunctionibus sex horas deme, et habebis intentum tuum. - Ad perpetuandum istud kalendarium, completis 4 cyclis addatur [[culibet]] numero annorum domini numerus 76, et deletis aliis scribantur isti numeri sic augmentati. Et sciendum quod post sui initium durat 76 annis, et tot ponuntur litterae primationis in 4^o cycl. .?»; et fuit iste kalendarius factus anno domini 1292, et iste numerus ponitur in principio primi cycli. Et notandum quod dies et horae incipiunt a media nocte praecedenti.**

(g) Manuscripts: O,1v; Md,72r; St,24r. Text from O, also recording a dittography in Md St, which are quite close in other respects as well.

(Letter table 1292(=Op.c.; 1298 Md St)-1653; O has a secondary row for 1216+. Hdg.): In ista parva tabula sunt iiiior cycli sive lineae ad sciendum quae sit littera primationis seu coniunctionis solis et lunae aut incensionis, et hoc¹ per annos domini. – (Txt:) Quaere ergo inter numeros in superiori parte istius tabulae numerum unum ex illis, qui maxime similis est² annis domini, et sit minor quam anni domini³. Si forte annos domini implete non⁴ inveneris⁵ ibi, tunc illum numerum comple et fac eum aequalem annis domini⁶, scilicet computando per litteras descendendo a sursum usque deorsum; et illa littera⁷, quae de litteris huius tabulae perfecit annos domini, primationis seu incensionis erit illius anni. [⁸Et sic⁹ praecise inveneris annos domini, scilicet computando per litteras descendendo a sursum usque deorsum, et littera illa quae de litteris huius tabulae perfecit annos domini, primationis seu incensionis erit illius anni.⁸] Et si praecise inveneris annos domini¹⁰, tunc ultima littera¹¹ lineae praecedentis versus sinistram erit primationis lunae illius anni. Verbi gratia, esto quod anni domini sint¹² 1311: eos invenies in capite secundae lineae versus sinistram, computando a sinistra, et ideo littera ultima lineae primae, scilicet T, erit littera primationis. – Et tunc quaeras eam in tali cyclo calendarii sive linea, in quali hoc¹³ est; et eo¹⁴ die luna primatur, et numerus subscriptus litterae in eadem cellula horam primationis ostendet; et in tali quarta horae, qualem angulum punctus occupaverit¹⁵, computando ab angulo superiori sinistro, terminando in inferiori sinistro. Nam si punctus est in primo angulo, primatur in prima parte; si in secundo¹⁶, primatur in secunda parte¹⁷; si in tertio¹⁸, primatur in tertia¹⁹; si in quarto, primatur in quarta parte²⁰. Si autem nullum punctum inveneris, in complemento horae illius luna soli coniungetur. Si vero duas litteras primationis²¹ in eadem cellula reperis, simplex²² numerus²³ et prior secundum algorismum²³ posteriori litterae attingit. Et sciendum quod dies et horae incipiunt in media nocte praecedente diem²⁴ secundum morem Romanae ecclesiae²⁵.

(h1) Manuscripts: Pr,34v; Bo,167v; Pe,25r-v. The final passage "Et scias quod luna. .et habebis intentum" is also in Mt,p.232 of the printed edition, and in Sf,1r; the main texts belong to class a₁ and c,

respectively. A similar passage has been intercalated in Oa (cf.(f2) above). The present text is that of Pr, with variants and emendations from Bo Pe, and from Mt Sf for the final passage.

(Pr,hdg.): Canon supra kalendarium (Bo,hdg.): Canon super coniunctiones novum magistri Petri de Dacia. magistri Petri de Dacia.

(Pr Bo Pe:) (Letter table 1292-1653(1672 with 1634 left out, Bo). Hdg.): Hic sunt anni domini, qui ostendunt¹ litteram coniunctionis solis et lunae omni anno². (Txt:) In capite istius tabulae sunt anni domini. Si ergo³ litteram coniunctionis solis et lunae invenire volueris, quaere in superiori parte istius tabulae annos domini,

(Pr Pe:) et quaere numerum accedentem ad annos domini propinquiorem, et sit minor quam anni domini; (Bo:) sed si non inveneris praecise numerum annorum domini, accipe numerum minorem, propinquiorem tamen ei;

(Pr Bo Pe:) et super eundem numerum et in eadem linea descendendo computetur, donec compleatur⁴ numerus annorum domini. Et si praecise inveneris annos domini, tunc ultima littera⁵ lineae praecedentis versus sinistram est littera primationis⁶ illius anni. Verbi gratia, esto quod anni domini sunt⁷ 1311: eos invenies in capite secundae lineae versus sinistram, computando a sinistris, et ideo⁸ littera ultima lineae primae⁹, scilicet T, est littera primationis¹⁰ illius anni. Et littera illa¹¹ de litteris huius¹² tabulae, quae perficiet annos domini, littera coniunctionis solis et lunae nuncupatur. Et diligenter considera, utrum inveneris¹³ eam¹⁴ in prima linea vel in secunda, et cetera¹⁵. - Quaecumque igitur littera coniunctionis¹⁶ inventa¹⁷, scias in qua linea est, et tunc quaeras eam in kalendario et in tali linea; et ubicumque inveneris litteram coniunctionis deservientem illi anno, in¹⁸ tali die luna soli coniungetur, et numerus niger subscriptus¹⁹ horam ipsius ostendit; et in tali parte²⁰ horae, qualem angulum punctum occupat, ²¹computando ab angulo superiori sinistro. Nam si punctus primum angulum occupat²¹, scilicet superiori²² sinistrae²³, tunc coniunctio erit in prima parte horae ascriptae²⁴; et si secundum angulum, scilicet²⁵ superiori²⁶ dextrae, tunc coniunctio²⁷ erit in²⁸ secunda parte horae; et si tertium angulum, scilicet inferiori²⁹ dextrae, tunc coniunctio erit in tertia parte illius³⁰ horae; et si in quarto angulo, scilicet inferiori³¹ sinistrae, tunc coniunctio erit in quarta parte³² horae ascriptae³³. Si autem duo puncta in eadem cellula inveniantur³⁴, rubeum posteriori litterae attinebit. Si vero³⁵ nullum punctum inveneris, in complemento horae ascriptae³⁶ luna soli coniungetur.

(Pr Bo Pe Mt Sf:) Et scias quod luna dicitur prima die³⁷ ³⁸sequenti scilicet³⁹ post coniunctionem, et in⁴⁰ hora consimili qua fuit coniunctio³⁸, quas horas⁴¹ computabis a media nocte praecedente, et sunt⁴² horae⁴³ aequales. - Transactis autem 76 annis⁴⁴, scilicet⁴⁵ anno domini⁴⁶ 1369⁴⁷, demantur de horis sex, et puncta⁴⁸ ad proximos angulos⁴⁹ in⁵⁰ antea situentur, et incurrent⁵¹ coniunctiones sicut⁵² prius. Et semper pro⁵³ 76 annis elapsis ab anno domini 1300⁵⁴ a coniunctionibus sex horas deme, et habebis⁵⁵ intentum.

(Pr:) Et tibi nota bene omnia ista.

(Mt:) Nota quod de minutis horarum parum curandum est, quoniam sufficit horam vel prope cognoscere, nisi propter prudentes et elevatos viros ne quisquam sapiens obviet in talibus.

(h2) Manuscripts: Bv,10v; Mk,1v; So,45r. The text of So is followed, with variants and occasional corrections from Bv Mk.

(Letter table, 1368-1577 Bv Mk; (blanks from 1292-)1349-1577 So. Hdg., from Bv Mk, incomplete in my copy of So:) Per annos domini inferius annotatos invenitur littera ostendens coniunctionem solis et lunae quolibet anno in singulis mensibus. (Above text:) In ista parva tabula sunt 4or cycli sive lineae quae continent litteras primationis seu coniunctionis solis et lunae positas in kalendario sequenti.

(Hdg., Bv So:) Canon super kalendarium magistri Petri de Dacia¹. (Txt, Bv Mk So:) Si igitur litteram coniunctionis solis et lunae invenire volueris, quare in superiori parte istius tabulae annos domini, et quare numerum accedentem ad annos domini propinquius, qui tamen² sit minor annis domini illius anni de quo quaeris. Et super eundem numerum annorum domini in tabula inventorum in eadem linea, in qua inveneris annos domini, descendendo computetur, donec compleatur numerus annorum domini illius anni de quo quaeris; et littera illa, quae perfecit annos domini, erit littera primationis seu coniunctionis solis et lunae illius anni. Si autem praecise inveneris annos domini, tunc ultima littera³ praecedentis lineae immediate versus sinistram erit littera primationis illius anni. Verbi gratia, esto quod anni⁴ sint 1368, quos invenies in capite primae lineae versus sinistram computando: tunc littera ultima, scilicet T, quartae lineae erit littera primationis illius anni. Si autem essent anni domini 1387, quos invenies in capite secundae lineae, tunc ultima littera, scilicet⁵ T, primae lineae erit littera primationis illius anni, et sic de

aliis. – Littera igitur primationis modo praedicto inventa, diligenter considera, utrum in prima vel in secunda vel in qua linea ipsam invenies⁶, et in kalendario eandem litteram in consimili linea quaeras; et ubicumque inveneris litteram primationis deservientem illi anno, in tali die luna soli coniungetur, et numerus niger litterae subscriptus horam coniunctionis ostendit; et in tali quarta horae, qualem angulum punctus occupat, computando ab angulo superiori sinistro⁷. Nam si punctus primum⁸ angulum occupat, scilicet superiorem sinistram, coniunctio erit in prima quarta⁹ horae ascriptae; et si secundum angulum, scilicet superiorem dextrum, coniunctio erit in secunda quarta horae¹⁰; et si tertium occupat, scilicet inferiorem dextrum, erit in tertia quarta; et si quartum angulum occupat, scilicet inferiorem sinistram, erit in quarta parte horae. Si vero nullum punctum inveneris, erit coniunctio in complemento horae ascriptae. Si autem¹¹ duo puncta in eadem cellula inveneris, rubeum posteriori litterae attinebit.

Et has horas computabis a media nocte praecedente¹², et sunt horae aequales, quia in hoc kalendario incipitur dies a media nocte secundum morem ecclesiae. – Et scias quod luna dicitur prima die sequenti, scilicet post coniunctionem, in hora consimili qua fuit coniunctio. – Transactis autem 76 annis a compositione huius kalendarii, quod compositum fuit anno domini 1292, demantur de horis 6, et puncta ad proximos angulos in antea situantur¹³, et evenient¹⁴ coniunctiones sicut prius. Et sic semper pro¹⁵ 76 annis elapsis subtrahantur ab horis sex, et punctis in antea situatis habebis kalendarium verificatum quoad coniunctiones solis et lunae usque in¹⁶ infinitum.

(h3) Manuscript: Bs,12v. Possibly an abbreviation of the preceding. See description of Bs for the context.

(Hdg.): Incipit canon de usu et utilitate kalendarii. (Txt:) Si igitur vis scire coniunctionem solis et lunae secundum aequationem magistri Petri de Dacia, quaere litteram primationis secundum annos domini, qua inventa <quaere> illam litteram in consimili linea in kalendario; et ubicumque litteram anno deservientem inveneris, in tali die luna soli coniungetur; et numerus litterae subscriptus horam coniunctionis ostendit, et punctus quartam partem horae, computando ab angulo superiori sinistro. Si autem nullum punctum inveneris, erit coniunctio in complemento horae ascriptae. Et notandum quod in hac aequatione incipiuntur horae a media nocte praecedente diem.

(J1) Manuscripts: N,69vb; D,13r-v. The text in N follows upon the canon reproduced as (e) above. The present text follows D, with variants and some corrections from N. Some lacunas in D, of a few letters each, have been tacitly supplemented.

(*D*, title on recto page:) Tabula primationis. – (Letter table, 1292-1729 D, 1292(filled in with "1672")-1653 N, where the table also goes with the preceding canon (e).) – (*D*, hdg.): Canon supra kalendarium magistri Petri de Dacia.

(*N D*): In ista parva¹ tabula sunt 4 cycli sive 4² lineae ad sciendum quae littera est littera primationum³. In quolibet cyclo sunt 19 litterae aureum numerum⁴ designantes, ita quod A deservit unitati, B binario, C ternario, et sic deinceps. Ad inveniendum⁵ quae istarum⁶ 19 litterarum sit littera primationum⁷, hoc habere possumus per numeros in superiori parte istius tabulae scriptos, per hunc modum: Quaere inter numeros in superiori parte istius tabulae scriptos numerum, qui minus distat a numero annorum domini, dum tamen sit minor, et tunc comple et perfice numerum annorum domini ex litteris cycli ipsi numero suppositi, pro uno anno quamlibet⁸ litteram computando; et quaecumque littera perfecerit⁹ numerum annorum domini, illa¹⁰ erit littera primationis¹¹ per totum illum¹² annum. – Littera igitur primationis inventa, scias in quo cyclo erit¹³, et tunc quaeras¹⁴ eam in tali cyclo kalendarii. Ubicumque inventa¹⁵ fuerit littera primationis deserviens anno, in quo quaeris novam lunam, ibidem dicitur luna prima, id est in coniunctione cum sole; et numerus subscriptus dabit, quota hora habeat luna¹⁶ imprimari. Et punctus dabit, quota parte horae¹⁷: quia, si punctus fuerit¹⁸ in superiori angulo cellulae versus sinistram partem, tunc luna erit prima in prima parte horae ascriptae; si vero punctus fuerit in superiori angulo cellulae versus dextram, tunc luna erit prima in secunda parte horae ascriptae; si vero punctus fuerit in inferiori angulo cellulae versus <¹⁹dextram, tunc luna erit prima in tertia¹⁹ parte horae ascriptae; si vero punctus fuerit in inferiori angulo cellulae versus sinistram partem, tunc luna erit prima in quarta parte horae ascriptae¹⁸. Sed²⁰ si nullum punctum inveneris, tunc luna erit²¹ in complemento illius horae, id est²² coniungitur soli. Si vero in eadem cellula²³ duos numeros et duos punctos et duas litteras²³ inveneris, numerum primum²⁴ primae litterae atribues²⁵ et secundum numerum secundae litterae²⁵. Si vero²⁶ duae fuerint litterae et unicus numerus, ille numerus²⁷ dicitur²⁸ utrique litterae deservire. Si vero solus punctus fuerit²⁹, ipsum primae litterae aptabis³⁰.

Si vis³¹ scire quae sit littera primationis in aliquo anno, divide annos domini per 76; si vero, facta divisione, aliquid remanserit et fuerit minus quam 20, tunc eris³² in primo cyclo et in toto anno illius cycli, quotus erit³³; si vero plus remanserit³⁴ quam 19 et fuerit³⁵ minus quam 39, tunc luna erit prima³⁶ in secundo cyclo et in toto anno illius cycli, quotus erit³⁷ ultra 19; si autem plus remanserit quam 38 et minus quam 58³⁸, tunc eris³⁹ in tertio⁴⁰ cyclo et in toto anno illius cycli⁴¹, quotus fuerit numerus ultra 38; sed si plus remanserit⁴² quam 57, tunc erit in quarto cyclo et in toto anno, quotus fuerit numerus ultra 57, et cetera⁴³.

(D:) Nota quod dies naturalis incipitur, quantum ad huiusmodi kalendarium exercendum, in media nocte, quia dominus Ihesus, qui est dies et vera lux, natus fuit in tali hora; dies artificialis, quando sol lucet in aurora, quae alio nomine vocatur crepusculum seu inter canem et lupum, et durat usque ad principium noctis, id est ad aliud crepusculum. Hoc dicatur ibi.

(j2) Manuscript: Re, Ir. {} enclose my guesses at the text where the writing is faint.

(Letter table 1292-1653. Hdg. :) En ceste petite table sont quatre lignes a sauoir les primations de la lune, et par les anz nostre seigneur.

(Hdg. :) La lettre a sauoir le vrai cours de la lune par le qualendier mestre Pierre de Dace dit Rosignol. (Txt:) Qverez entre les nombres ou chief de ceste petite table l nombre samblable aus anz nostre seigneur et qui soit meins {que} le{s} anz nostre {seigneur}. Et s'il est ainsi que lez anz nostre seigneur n'i soient mie parte(?) queres le nombre qui est mieus samblable aus anz nostre seigneur, et la complisies et le fetes egal aus anz nostre seigneur, ch'est a dire que vous devez conter chancune lettre pour vne annee en contant d'en haut vers bas; et la lettre qui parfera les anz nostre seigneur ou vous serez, sera la lettre de primation toute sele annee. Et s'il est ainsi que les anz nostre <seigneur> soient 1311, vous le troueres ou chief de la seconde ligne vers senestre en contant a senestre, et donques la darreniere lettre de la premiere ligne, c'est a sauoir T, sera la lettre de primation, c'est a dire que la lune courra par sele lettre toute sele annee. – Et en queconque (queque *ms.*) ligne que vous troueres la lettre de primation de la lune en vostre table, queres vne autele lettre en vostre kalendier et en autele ligne. Et sachies que en queconque lieu que vous troues la lettre de primation <qui> sert a l'annee de quoi vous queres primation, a tel iour est la lune prime, c'est a dire nouuele; et le nombre qui est desous escrit vous demonstre les heures, c'est a dire a quel heure la lune se renouele de ce mesme iour; et le point senefie la partie de cele mesme heure. Car chacune heure est deusee en quatre parties, et se le point est en haut vers senestre, vous direz que c'est en la premiere partie de cele mesme heure; et se (ce *ms.*) le point est en haut vers destre, c'est en la seconde partie; et s'il est en bas vers destre, c'est en la tierce partie; et se il est en bas vers senestre, c'est en la quarte partie de cele mesme heure. Et se vous

i troues 2 poinz en 1 mesme parket et 2 lettres, donnes le point rouge et lez heures rouges a la darreniere lettre. Et si n'i a nul point aueques les heures, la lune est conioingte au solail. Et sachiez que le iour et les heures commencent a minuit.

(j3) Manuscript: Ro,63v-64v. Extended version of (j2).

(Letter table 1292-1653. Subscr. :) En cheste petite table sont chiclees en 4 lignes a sauoir les laitres de l'inpri(ma)sion de la lune par les ans nostre segnieur.

(Hdg. :) Chy est la l(ett)re du kalendier mestre P(er)res de Dace. (Txt:) Qyeres entre les nombres v chief de cheste petite table 1 nombre senblabe as ans nostre segnieur, et qui soit mendres que[r] les ans nostre segnieur. S'il est ainsy que les ans nostre segnieur n'i soient mie, adonques pran le nombre qui est le miex senblabe as ans nostre segnieur, che est a sauoir en contant de hault iuques en bas, et ychelle lestre des leitres de la petite table qui parfera les ans nostre segnieur, sera la laitre de l'inprimasion de chelle anee. Et s'il est ainsy que 1292 soit le plus prochain, compte les ans nostre segnieur, tu le trouueras au chief de la premiere lingne, et le parferas des laitres qui sont en la premiere lingne en contant de A vers T, et saches que chacune de ches 19 lestres fait 1 an, et conpteras ainsy: A sera 1293, B sera 1294, C sera 1295, et ainsy tant que tu aies trouue Mil 3^e et 3; et L sera toute chelle anee la l(ett)re de l'inprimasion, et quant 1304, sera M la l(ett)re de l'inprimasion, et puis apres N et puis O et ainsy ensuiant iuques a T, et puis seras en la seconde lingne, et recommenche A, et iras iuques a T. Et ainsy (auiue *ms.*) ensuiant de toutes les 4 lingnes. Et quant les 4 aront couru (co)ueu *ms.*), sy recommencheras ariere en la premiere lingne et feras comme est dit. – Et en quelconques lingne que tu trouues la laitre de l'inprimasion, tu la dois querir en autelle lingne en ton calendier. Et saches en quel lieu tu truis la l(ett)re de l'inprimasion, tu trouueras le nombre desous escrit qui te dira a quel heure che est de che meimes iour. Se le poins est en la premiere partie en hault vers main senestre, vous direz lune e<(s)t prime par tant d'eures en la premiere partie de chelle heure; et se le poins est en la secon<(de) partie en hault vers main destre, che est en la seconde partie de chelle mesme heure; et se le poi<(n)t est en bas vers main destre, che est en tierche partie de chelle meimes heure; et se le point est en bas vers la senestre partie, che est en la carte partie de chelle meimes heure. Et s'il est ainsy que tu truis 2 poins en 1 meimes parquet, tu donras le point rouge a la derraine l(ett)re. Et se tu n'y trouues nul poins, tu diras la lune est coniointe au solail, car le iour et les heures commenchent a minuit.

(k) Manuscript: Kt,1r.

(Hdg. :) Cy commence la table de maistre Piere de Dacia pour trouuer la lettre qui enseigne le iour et le heure de la coniuccion de la lune au soleil selon

l'enseignement du canon qui ensieut. (Letter table 1292-1653. Subscr.): Cy moustre par ces quatre ciclé la figure du nombre d'or.

(Txx:) Qveres en ceste table en quelque ciclé ou ligne que ce soit ung nombre le plus prochain que poures trouuer a l'incarnation de nostre signeur, et se ce nombre n'est pareil a celuy que querres, si le parfaites des lettres qui sont en ce meismes ciclé. Exemple de ce, sachies que en l'an mille cccc et xli n'i auoit point de nombre plus prochain que mille cccc xxv, et fut trouue en le ligne dextre, et fut aiouste aueuc tant des lettres de ce meisme ciclé que le Q parfit le nombre de mille cccc xli que queroie. – Et trouuai au lon de celuy an en tel siclé de kalendier Q, et a tel jour et telle heure q(ue) estoit la coniunction de la lune au soleil en ch(ac)un mois de celuy an. Item sacies que le lieu ou est trouuee le lettre en le kalendier signefye le iour de la primacion de la lune; et le nombre qui est escript dessous le lettre signefie l'eure. Et le point qui par hault est a senestre, signefie la lune soy refaire en la premiere quarte del heure; et celui point qu'est par hault a dextre, signefie en la seconde quarte; et celui point qu'est par bas a dextre, signefie en la iii^e partie del heure; et celui point qu'est a senestre par desous, signefie en la daraine quarte. Et se nulz poins ne sont trouues, la coniunction est a l'eure trouuee. Et fault commencer a conter voustre jour apres minuit deuant passe.

Item en l'anee de mille cccc et xliiii, lequel nombre est trouue en la senestre ligne, sera le T, qui est en la dextre ligne, lettre de la coniunction de celuy an, et A, qui est commencement de la ligne senestre, sera la lettre de la coniunction en l'an mil cccc et xlv.

(11) Manuscript: Pd,56v and 58r(from "Habita notitia. . .").

(Letter table 1293(!)-1426(!), no hdg.) (Txx:) Si vis invenire litteram deservientem coniunctioni, intra ad sinistram partem tabulae et quaere numerum annis domini magis acce[n]dentem, iuxta tamen, et descende[re] sub numero, computando donec compleas annos domini; et littera, ubi terminabitur annus, deserviet coniunctioni illius anni. Verbi gratia, annus domini curreret in 1340: numerus, qui magis acce[n]dit ei ex parte (experte Pd) inferiori, est 1331. Computa ergo sic: super A 1331, super B 1332, et sic de reliquis; terminabitur ergo numerus super K, quae deserviet coniunctioni illius anni. Et sic facies semper, quandocumque volueris invenire litteram deservientem coniunctioni, renovando eam in Ianuario.

Habita notitia litterae deservientis coniunctioni, quae habetur per tabulam cyclorum, si vis invenire coniunctionem solis et lunae, intra in sinistra parte mensis, de quo vis scire, et quaere cyclum in quo invenisti litteram praedictam: unde, si litteram invenisti in primo cyclo, quaere primum cyclum, et sic de reliquis; et quaere ibi litteram praedictam. Et in illa die, in qua fuerit littera, erit coniunctio, et in illo signo et gradu in quo fuerit sol illa die; et numerus, qui est sub littera, determinat horam, et punctus partem horae: unde, si punctus fuerit in superiori angulo versus <sinistram, in prima parte; si

in superiori angulo versus> dextram, in secunda; si in inferiori versus dextram, in tertia (4^a Pd); si versus sinistram, erit in 4^a parte horae. Et si non fuerit punctus, erit in fine horae coniunctio.

(12) Manuscript: Da,173v.

(Letter table 1292-1653. Hdg.:) Tabula ad inveniendum litteram imprimationis lunae. (Txt:) Accipe numerum propinquiorem minorem incarnationi domini, et quod tibi deficiet, comple de litteris subsequentibus in directo illius numeri, cuilibet anno attribuendo 1 litteram, donec habeas numerum completum tibi praesentem, in quo es vel quaeris; et littera, ubi deficit numerus, est illa quae erit anno illo in quo quaeris. Verbi gratia, si habes [[1330]] 1340, intra per numerum 1330, et in directo computa a prima littera A usque 10 inferius procedendo, et habebis litteram K.

Appendix 3. Variant canons to T.L.

Synopsis:

(a1) Lo,10r-v. **(a2)** Le,19r; Ow,153r; Od,53r. **(a3)** Bv,10r; Mk,1r.

These texts are all close to the standard one; there seems to be no further relation between them. The manuscripts of (a1) and (a2) are English, part of them containing later calendars.

(b1) Pl,30v. **(b2)** N,69va. **(b3)** Re,8v(in French).

All occur in some connexion with the Calendar.

(c1) Ny,16r-v; Pe,41v-42r; Od,7r-v. **(c2)** Wi,14r; Sx,1r. **(c3)** Pn,1r; Pn,13r. **(c4)** Bx,9r-v(in French). **(c5)** Pd,58r(affiliation dubious).

All possibly cognate with the texts under (b). The contexts vary.

(d1) Fp,96r; P3,96r; S,21v; Or,140r; N,70r. **(d2)** X,9r. **(d3)** So,56v (mixture with (d1)?). **(d4)** N,70va(to (b)?). **(d5)** V,68v (much extended, affiliation dubious).

Except P3, these are more or less closely connected with the Calendar.

(e) Oa,152r.

(f) Mz,133r.

(g) Ny,16r; Pr,24v.

(f) and (g) occur together with later calendars.

A further canon may be hidden in the French subscription to the T.L. in Pr,1r. The subscription in Kh,151r, simply refers to the *Computus Chirometralis*.

(a1) Manuscript: Lo,10r-v.

(Hdg.): *Tabula ad sciendum in quo signo luna est omni die, et in quo gradu eiusdem, in sequenti tabula secundum magistrum Petrum. (Txt:) Ad locum etiam lunae habendum videas quota est dies coniunctionis ab ingressu signi, in quo fuerit coniunctio; et in toto gradu eiusdem sol et luna coniungentur, et ita habebis locum lunae ad diem coniunctionis. Sed si locum eius ad quemcumque alium diem quaesieris, cum numero dierum a die coniunctionis perfectorum in tabulam istam consequentem intres, et e directo eiusdem diei sub coniunctionis signo descendens invenies signum, in quo est luna. Et si gradum eiusdem signi scire volueris, respice numerum qui est a dextris tabulae e directo dierum (diei et ms.) quos invenisti, quia numerus ille tibi demonstrabit gradum signi, in quo est luna, si coniunctio facta fuerit in primo gradu cuiuscumque signi. Sed si in quocumque alio gradu signi facta fuerit*

coniunctio, cum numero graduum, quos invenisti a dextris tabulae, numerum graduum coniunctionis addas, et si aggregatum minus 30a fuerit vel ipsum 30a, gradum signi, in quo est, tibi ostendet; et si 30a excresc[er]it, abice 30a et residuum retine, quia tibi dicet in quo gradu signi subsequenteris luna fuerit die quaesito, hora consimili horae coniunctionis, a media nocte die incepta. Nihil enim computatur in tabula ista de mense aliquo, priusquam coniunctio solis et lunae facta fuerit in eodem mense et in eius signo.

Vocatur itaque totum tempus ab una coniunctione ad aliam una lunatio, et continet in se 29 dies 12 horas et 45 minuta. Et dividitur quodlibet signum in 30a gradus, quilibet gradus in 60a minuta, quodlibet minutum in 60a secunda, quodlibet secundum in 60a tertia. Et nota quod luna 12 signa zodiaci in 27 diebus et 8 horis percurrit, manens in quolibet signo duobus diebus naturalibus et fere 8 horis. Cursus eius in die naturali est 13 gradus et 10 minuta.

(Subscr.): Finis tabulae praecedentis.

(a2) Manuscripts: Le,19r; Ow,153r; Od,53r. Text from Od, variants and some corrections from Le; Ow, which has a few errors against Le and is probably an apograph of it, has been disregarded. The tables of Le Ow have an expanded right entrance (cf. *Pref.* §22), whence variant no. 5.

Cum scire volueris¹ locum lunae omni die per tabulam signorum, videas quota est dies coniunctionis solis et lunae in tabula coniunctionis ab ingressu signi, in quo est sol, [et² videas per tabulam solis pro illo die, in quo gradu est sol,] quoniam in tali gradu eiusdem signi sol et luna³ coniunguntur: et ita habes locum lunae ad diem coniunctionis. Et si locum eius ad quamcumque aliam quaesieris, cum numero dierum a die coniunctionis perfectorum in tabula de loco lunae inveniendo intres, et in⁴ directo eius sub signo coniunctionis descendens, in angulo correspondenti numero dierum a prima linea tabulae signum invenies, in quo est luna, et similiter invenies gradum et minutum signi illius ⁵versus dextram in directo numeri dierum⁵; hoc tamen supposito, quod coniunctio solis et lunae⁶ fuerit in primo gradu alicuius signi. Si vero coniunctio fuerit in aliquo alio gradu, tunc adde omnes gradus signi illius, videlicet⁷ a principio signi illius usque in gradum coniunctionis, super gradus inventos in linea graduum et minorum a dextris⁸ inventa, et habes⁹ locum lunae in meridie illius diei¹⁰ medium. Et¹¹ si post additionem plures gradus fuerint quam 30, abiectis illis¹² 30 gradibus residuum ostendet, in quo gradu signi sequentis sit luna, die quaesito, hora consimili horae¹³ coniunctionis, ¹⁴a meridie diei praecedentis diem incipiendo¹⁴.

(*Od.*) Nota quod in tabula coniunctionis solis et lunae horae et minuta ibidem inventae sunt eiusdem diei, super quam positae sunt, et non diei sequentis.

¹v.s. Le ²om.Od ³solis et lunae Od ⁴e Le ⁵hic simul cum numero

(a3) Manuscripts: Bv,10r; Mk,1r.

(*Bv*, hdg.): Ad locum lunae habendum quolibet die. (*Bv Mk*): Videas igitur quota est coniunctionis dies ab ingressu solis in signum, in quo est sol, et in toto gradu eiusdem signi sol et luna coniungentur, et ita habebis locum lunae quoad diem coniunctionis. Si autem locum lunae ad alium diem quam ad diem coniunctionis habere volueris, cum numero dierum a die coniunctionis perfectorum intra tabulam infra positam, et quaere numerum aetatis lunae, quem invenies in sinistra parte tabulae; et signum, quod e directo illius numeri invenies sub signo, in quo est sol, quod invenies in capite tabulae, est signum in quo erit luna; et in quoto gradu¹ eiusdem signi sit luna, ostendit numerus graduum in dextra parte tabulae stantium e directo numeri dierum. Et hoc est verum, si coniunctio in primo gradu signi fuerit; sin autem, numerum graduum in tabula sic² inventorum et numerum graduum signi in die coniunctionis inventorum simul coniunge³. Et si aggregatum fuerit minus quam 30, in tali gradu signi inventi erit luna; si autem plus fuerit quam⁴ 30, abiectis 30 numerus residuus ostendit, in quoto gradu signi sequentis erit luna die quaesito, hora consimili horae⁵ coniunctionis, a media nocte die incepta. Si autem ad alias horas locum lunae habere volueris, semper pro duabus horis unum gradum et <6> minuta gradibus inventis adiunge. Et hoc est verum, si vis ad horam sequentem horam coniunctionis; si autem ad aliquam horam praecedentem, quod praedictum est subtrahe, et habebis sic locum lunae ad quamcumque horam diei volueris.

¹om.Mk ²sit Bv ³iunge Mk ⁴vel quasi Bv ⁵ho(m)i(n)e Bv

(b1) Manuscript: Pl,30v. Possibly an extension of (b2).

Ad inveniendum certissime signum et gradum, in quo est luna, videas in calendario, in quo signo est sol, quia in eodem signo est luna in die coniunctionis tantummodo. Si autem locum eius ad aliquem alium diem lunationis scire volueris, tria sunt principaliter considerata, scilicet aetas lunae, et quot sunt dies sive gradus ab introitu solis in signum, et dies etiam coniunctionis ac ordo signorum. His scitis intra tabulam, incipiendo directe sub signo, sub quo facta fuit coniunctio, cum aetate lunae ad diem intentum; et habebis e directo eiusdem diei signum et gradum, in quo est luna, si coniunctio lunae cum sole facta fuerit in die introitus solis in signum, quod aliquotiens contingit; sin autem, supra numerum graduum ibidem inventorum addas numerum graduum signi perfectorum ab introitu solis in signum

usque ad diem coniunctionis solis et lunae. Et si numerus ille est infra 30a, in tali gradu signi inventi est luna; si autem ultra 30a numerus talis excreverit, tollas ab eodem numero 30a, et dicas lunam praesentis diei esse per tot gradus in signo sequenti, quotus est numerus residuus aut superexcrevens ultra 30a, incipiendo diem a media nocte praecedente. Si autem ad ali[qu]am horam diei hoc scire volueris, videlicet in quo gradu signi inventi sit ipsa luna, pro duabus horis unum gradum debes semper computare.

Sciendum est igitur quod signum, in quo fit coniunctio solis et lunae, semper est ponendum in principio computationis in capite tabulae in ordine signorum. – Praeterea secundum rei veritatem est notandum quod luna dumtaxat moratur in quolibet signo per duos dies et sex horas et per unum bisse. Bisse autem est gemina pars unius rei divisae in tres partes aequales. Hora vero continet 60a minuta. Sed bisse non continet nisi 40a minuta tantum, videlicet duas partes unius horae.

(b2) Manuscript: N,69va. To the lunar table reproduced in App.4(c). The present text appears as a shorter version of the preceding.

(Hdg.): Tabula lunae abbreviata et correpta per magistrum Petrum de Dacia, correctorem huius kalendarii. (Txt:) Ad inveniendum signum et gradum, in quo est luna, videas in kalendario, in quo signo est sol, quia in eodem est luna in die coniunctionis tantummodo (t(antu)m M^a ms.). Si autem locum eius ad aliquem alium diem scire volueris lunationis (-ones ms.), tria sunt principal(ite)r consideranda, scilicet aetas lunae, et quot sunt dies ab introitu solis in signum, et dies (diem ms.) coniunctionis ad ordinem signorum. His scitis intra tabulam cum aetate lunae ad diem intentum, et habebis e directo eius signum et gradum, in quo est luna, si coniunctio fuerit in die introitus solis, quod contingit. Sin autem, supra numerum graduum ibi inventorum addas dies ab introitu signi usque ad diem coniunctionis; et si numerus ille est infra 30, in tali gradu signi inventi est luna; si autem ultra 30 excreverit, tolle 30 <et> dicas lunam esse per tot gradus in signo sequenti, quotus est numerus residuus. Si autem ad ali[qu]am horam diei volueris ipsam invenire, pro duabus horis 1 gradum computabis.

Scias quod illud signum, in quo est (in ms.) coniunctio (-ctus ms.), semper ponendum est in principio computationis in capite tabulae in ordine signorum.

(b3) Manuscript: Re, 8v.

(Hdg.): Ch'est a sauoir la table de la lune mestre Pierre de Dace. (Txt:) Se vous vouldes sauoir en quel signe la lune est et en quel degre, vous devez sauoir en quel signe li solaus est quant la lune est nouele; et sachies que li solaus met 1 an aler sus les 12 signes, et la lune les va touz 12 en 1 mois. Se vous vouldes sauoir le signe ou la lune «est», queres le signe du solail ou la lune fu nouele en vostre table, et vous le troueres ou chief de vostre table. Et quant vous aves

troué le signe du solail, sachies l'age de la lune, ch'est a dire quant iours la lune a puis qu'ele fu nouele deques au iour ou vous estes; et ne contes pas le iour que ele fu noueue. Et quant vous aues troué l'age de vostre lune, queres la en vostre table, et vous la troueres en la premiere ligne vers senestre; et ales en contre le iour ou vous seres, en descendant de sous le signe du solail, et dites la lune est en tel signe par tant de degres com vous troueres en la darreniere ligne vers destre, mes que vous aioutes les degres du solail, qui sont entre la lune et le solail, auèques les degres de la lune, se l'aioustemement est meins de 30; et se l'aioustemement est plus de 30, ostes les 30 et prenes le remanant, et dites que vous est(es) ou signe ensuiuant «par tant de degres». Et quant la lune est nouele en contre le signe du solail, il ne conuient riens aiouter au degre(s) de la lune.

(c1) Manuscripts: Ny,16r-v; Pe,41v-42r. Text from Ny, variants and a few corrections from Pe. Od, on f.7r-v, has a text worded mainly like that of Ny, but with lacunas. Excerpts of this are given at the end of this section.

(Ny:) (Hdg.:) Item al. (Txt:) Si quis desiderat (Pe:) (Hdg.:) Ad sciendum in scire in quo signo erit luna omni die per quo signo luna sit omni die[i] annum, in primis debet (Txt:) primo debetis

(Ny Pe:) scire aetatem lunae, postea in quo signo erat¹ sol in die coniunctionis et in quo gradu eiusdem signi. Deinde quaere aetatem lunae a sinistris tabulae sequentis², et tunc quaeras signum solis in suprema³ linea eiusdem tabulae, ubi sunt 12 signa⁴, scilicet ab ariete usque ad pisces; et sub illo signo⁵ solis descende⁶ in directo aetatis lunae, et inuenies signum lunae⁷ sub signo solis⁸ contra aetatem lunae a sinistris⁹, et¹⁰ gradum lunae¹¹ inuenies a dextris contra aetatem eiusdem¹². Sed cum illis¹³ gradibus debes¹⁴ addere gradum¹⁵ signi solis, in quo¹⁶ erat sol in die coniunctionis; et si gradus solis et lunae simul collecti minus 30 fuerint¹⁷, tunc¹⁸ luna adhuc erit¹⁹ in eodem signo, quod erit contra²⁰ aetatem eius; sed²¹ si gradus solis et lunae simul collecti²² ultra 30 excreverint, tunc luna erit in alio signo sequenti, scilicet inferius²³, et hoc²⁴ in totali gradu²⁵, quotus fuerit numerus²⁶ residuus ultra 30; et habebis locum lunae ad horam consimilem²⁷ qua fuit coniunctio. Si autem ad alias horas gradus²⁸ lunae scire volueris, accipe horas quas vis, et semper pro 2 horis 1 gradum computabis; sed²⁹ si est pro horis praecedentibus³⁰, a loco lunae subtrahe, et³¹ si est pro³² horis³³ sequentibus, adde, et sic locum lunae ad quamlibet³⁴ horam poteris inuenire.

(Ny:) Gradum solis sic inuenies et in quo gradu signi erit sol omni die: Quaere diem mensis, in quo sol signum intrat, et computa omnes dies ab eodem die, illo non computato, ad diem quem quaeris, et pro qualibet die 1 gradum illius signi accipe. Et sunt 12 signa, scilicet aries, taurus, gemini, cancer, leo, virgo, libra, scorpius, sagittarius, capricornus, aquarius, pisces, et per illa signa supercaelestia membra humani corporis d(⟨) dividuntur.

(d2) Manuscript: X,9r. Shorter version of the preceding.

(Hdg.): Canon ad sciendum locum lunae. (Txt:) Si vis scire locum lunae, scias aetatem eius et signum, in quo sol erat quando luna fuit prima; quo scito accipe aetatem lunae et quaeras in capite tabulae signum solis, sub quo descende[ns] usque ad aetatem lunae, et inuenies signum lunae et gradum eiusdem signi a dextris ascriptum ad diem praesentem. Et cum illis addas illos gradus, in quibus sol erat quando luna fuit prima; et illud quod resultat est gradus lunae, eiusdem signi, si 30 non excesserit. Sed si ultra 30 numerus excreverit, tantum debes accipere in signo sequenti pro gradu lunae. Et erit locus lunae similis coniunctionis horae. Et nota quod dies et horae incipiunt a media nocte praecedente diem.

(d3) Manuscript: So,56v. Resembles (d1) at the start and (c1) at the end.

Notandum, si volueris scire in quo signo sit luna in quolibet die secundum tabulam suprascriptam, considera gradum coniunctionis solis et lunae, et cuius signi fuerit ille gradus, in die coniunctionis; quo scito accipe aetatem lunae, et istam inuenies a sinistris tabulae in prima linea, et descende directe sub signo supraposito, in quo coniunctio facta fuerit (*vel* fuit), usque ad signum correspondens aetati lunae, quia tunc in isto signo directe erit luna, et in toto gradu eiusdem signi, quotus scriptus fuerit numerus in ultima linea versus dextrum, correspondens illi signo et aetati lunae; et hoc addendo gradus solis, quos sol habuit in coniunctione, ad gradum lunae, et si ultra 30a numerus graduum excreverit, tunc 30a pone pro signo [[sequenti]], et si aliqui fuerint ultra, in tot gradibus signi sequentis «directe» erit luna ad diem tibi placitum, ad horam † in sp(eci)e† coniunctionis. Si autem ad alias horas diei gradum lunae scire volueris, accipe horas quas vis, et semper unum gradum pro duabus horis computabis et e converso fac, et habebis intentum. Et scias quod luna dicitur prima die sequenti post coniunctionem, etc.

(d4) Manuscript: N,70va.

Respice coniunctionem solis et lunae, id est quando nova sit luna, et vide (inde N) in quo gradu sit sol, quia in eodem est luna. Serva hunc gradum et

signum, et verte te ad tabulam lunae, et vide quotus sit dies lunationis, et illum quaere in linea sinistra, ubi "aetas lunae" scribitur, et ibi tene digitum, et vide superius signum in quo fuit primata luna, et descende usque ad communem angulum; et ibi in dextra parte invenies gradum lunae, super quem addas gradum illum super quem fuit luna primata seu in coniunctione; et si excreverunt(!) 30, recipe tantum de signo sequenti, quantum est numerus residuus ultra 30. – Aliquando autem sunt †cellulae duae, aliquando tres: hoc est pro tanto quia plus currit luna quolibet die quam 13 gradus; tunc oportet diligenter videre, utrum plus in praecedenti fuerit in eodem signo, et hic videtur, quia si fuerit aggregatum plus quam 30, nunc fuit in eodem signo†

(d5) Manuscript: V,68v.

Ad sciendum tabulam istam, per quam habetur signum et gradus in quo est luna quolibet die anni, oportet te scire primo, in quo signo et in quo gradu signi fuerit coniunctio solis et lunae. Et hoc scias sic: Videas in quota die mensis fuerit (*vel* fuit) coniunctio solis et lunae, et super tot dies addas 15, non computando illum diem in quo facta fuit coniunctio illa. Et si ille numerus, qui resultat ex tali additione, minor fuerit quam 30, tunc sol et luna fuissent coniuncta in illo signo, quod attribuitur illi mense, in quo facta fuit praedicta coniunctio, et in tali gradu eiusdem signi, qualis numerus resultasset ex additione praedicta, scilicet dierum mensis completorum cum 15. Sed si numerus, qui resultat ex tali additione, fuerit maior quam 30, depone 30, et si aliquid fuerit ultra illud, ostendet tibi gradum signi proximi sequentis, in quo signo et in quo gradu eius tunc sol est cum luna coniunctus. Et si nihil remanserit postquam reiecasti 30, dic tunc quod coniunctio fuit in primo gradu signi proximi sequentis, mense sequenti attributi. Debes ergo scire quod unusquisque mensis habet aliquod signum sibi attributum, sicut Aprilis attribuitur arieti, Maius tauro, Iunius geminis, Iulius cancro, Augustus leoni, September virgini, October librae, November scorpionis, December sagittario, Ianuarius capricorno, <Februarius aquario,> Martius piscibus. – Unde versus:

Ap aries, Ma tau, Ju ge, Jul can, Au leo, Sep vir,

Oct libra, No scor, De sa, Jan cap, Feb a, Mar pis.

Hic primae syllabae semper nominant menses, secundae vero signa eis attributa. Sic ergo habes in quo gradu cuius signi fuit coniunctio, vel est vel erit coniunctio.

Habito ergo signo et gradu eius, commenda diligenter ipsum memoriae. Deinde vide aetatem lunae in aliqua die, in qua scire volueris eius gradum et signum secundum medium motum, videndo scilicet quot dies sunt perfectae de eius aetate; et cum tot diebus intra ad numerum dierum ad manum sinistram scriptum in hac tabula, et super (semper *ms.*) illum numerum pone digitum unum, ipsum custodiendo scilicet. Et videas ubi stet signum in linea suprema eiusdem tabulae, in quo signo facta fuit coniunctio, quod prius memoriae commendasti, et cuius gradus etiam, si [plures] fuerint [vel] gradu(s), prius commendasti memoriae; videas ubi stet, et descende sub eodem signo directe cum alio digito, quousque in directo numeri, qui est in

aetate eius, quem prius cum uno digito custodisti; et quodcumque signum stet in illa cellula, in illo est luna, et in toto gradu eius, quotus fuerit numerus graduum scriptus in ultima linea ad dextram in directo diei vel dierum, cum qua vel cum qu[al]ibus intrasti. Et scias quod istud est verum, supposito quod invenisses (-set *ms.*) praedictam coniunctionem fuisse factam in principio illius signi, quod prius memoriae commendasti. Sed si non fuisset facta in principio signi, immo forte in 6. vel in 7. gradu illius signi, vel in quocumque gradu illius signi, addas omnes illos gradus super gradus iam inventos in ultima linea versus dextram manum, et habebis gradum caeli, in quo fuerit luna in die [ad diem] in qua volueris. Et si forte numerus graduum resultans ex tali additione maior est quam 30, tunc debes reicere 30 pro illo signo, quod prius in suprema linea accepisti, scilicet pro illo signo in quo facta fuerit praedicta coniunctio, et sub quo signo etiam tunc descendisti usque ad directum dierum qui fuerint in aetate lunae usque in diem in quo es; et si sit unum in residuo, tunc luna est in primo gradu signi proximi sequentis, et si sint duo in residuo, tunc est in secundo gradu eius, et sic deinceps. Et si nihil fuerit residuum, postquam reiecisti 30 pro praedicto signo, adhuc erit in primo gradu proximi signi sequentis, scilicet iuxta principium illius gradus. – Est autem ordo et successio signorum denominatus in his versiculis, inceptis in ariete, qui est primum signum: Est aries taurus etc.

(e) Manuscript: Oa,152r.

Si per hanc tabulam locum lunae invenire volueris, scilicet signum et gradum in quo est luna, operab(er)is sic: Videas enim aetatem lunae in prima linea huius tabulae, et signum quod in directo eius fuerit, sub signo tamen sub quo luna fecit, et illud est signum in quo est luna; numerus autem graduum in directo illius diei repertorum est numerus graduum signi, in quo est luna, hoc tamen supposito, quod «si» luna fecerit et innovata fuerit in principio signi. Si autem in aliis partibus fuerit innovata, supra numerum graduum iam inventorum in tabula adde gradus, quos pertransivit luna in signo tempore suae innovationis; et ex ista additione si excrevit «minus» 30a, quod excreverit erit numerus graduum signi, in quo est luna; si vero plus 30a excreverit, abiectis 30a quod remanserit erit numerus graduum signi sequentis inferius reperti in tabula. Utrum autem in principio signi vel in alio quovis gradu luna innovata fuerit, scire poteris per signum et gradum solis tempore suae innovationis: cum enim luna innovatur, oportet esse in eodem signo et gradu signi cum sole.

(f) Manuscript: Mz,133r. Included in a set of canons to a calendar starting in 1463 (App.5(j9)).

Si gradus lunae quolibet die determinate scire volueris, scias primo determinate horam diem et minutum coniunctionis proximo praeteritae, et ad idem tempus medium motum solis, id est signum et gradum et (?a(ut) *ms.*) etiam

minutum, si placet, medii motus solis. Scias etiam aetatem lunae sive lunationis, a tempore scilicet coniunctionis numerando dies perfecte transactos usque ad diem considerationis tuae; quibus habitis, intra tabulam istam, gradus scilicet lunae, cum signo solis in superiori parte tabulae et cum aetate lunae in sinistra eius parte; et in angulo concursus primo signum lunae habebis. Gradus vero et minuta ipsi correspondentes angulo adde gradibus et minutis medii motus solis tempore mediae coniunctionis, et habebis determinatum gradum lunae, immo fere minutum in quo est luna, ad horam «?eius» diei consimilem horae coniunctionis; isto generali notato quod, si ex tali additione minuta excreverint 60, adde pro 60 deletis unum gradum gradibus, et si gradus 30 excesserint, totidem abiectis adde pro eis unum signum signis lunae.

(g) Manuscripts: Ny,16r; Pr,24v. The contexts include the English calendars mentioned in App.5(j7). This canon serves for lunar tables with multiple entrances for the degree-values (cf. descriptions of Ny,18v-19r; Pr,22r; *Pref.*, §22), where degree-values belonging to different signs have been separated by red lines (text below). In Pr the canon has been attached to a T.L. which is almost the standard one. In Ny it forms the second part of a note on the signs headed "Canon tabulae [[?]]". Text from Ny, with variants and corrections from Pr.

Ut autem signum et gradus lunae prompte habeantur, intrandum est in capite¹ sub² signo et gradu, in quo fuit ipsa coniunctio³, vel cum gradu sibi propinquiori minori, et⁴ cum aetate lunae ad latus sinistrum, in quorum concursu⁵ gradus ipse, vel per solam additionem excessus ad ipsum⁶, ibi invenitur, qui illius signi correspondens⁷ erit⁸, ad quod ducet te⁹ linea rubea proximo transversalis.

(Ny:) Et rubea enim linea proximo superior signum ostendet, si coniunctio fuerit in signis septentrionalibus, quae in capite tabulae scribuntur¹⁰ a sinistris, sed rubea proximo <inferior> idem ostendet, si coniunctio fuerit in signis meridionalibus, quae ponuntur a dextris.

(Pr:) Rubea enim linea inter gradus et signa distinguit.

Appendix 4. Lunar tables other than T.L.

See *Preface* §22 for some lunar tables which may be taken as developed from T.L.

(a) *Tabula lunae* (12×12, beginning with Aquarius; an upper entrance row shows month-names beginning with January; in the left entrance column, with the age of the moon, numbers shared between two adjacent rows are either replaced by two "S" or simply written over the row-boundary. There is no right entrance column). See p.14, and P.L.90,753-4. Cordoliani (1955b,308; 1960,117 n.50) knows ninth-century manuscripts of it, and puts it at least as early as Bede. In our period it was very common, often in company with Grosseteste's calendar (*Pref.* §6) and/or the *tabulae Gerlandi* and *tabula terminorum* ((a2) below); see *Pref.* §2c for examples of manuscripts.

In the manuscripts L,9r; Kr,9r; W,67v; Md,74r; Ef,199r, the table occurs in connexion with the Calendar or related texts. In M8,55r; *p.14* Vp,175v, it has been ascribed to Peter of Dacia, and attempts have been made to fit it with one or both entrance columns of the T.L., as has also happened in W. Conversely, in S,21v and Oa,152r the T.L. has been provided with a left entrance column from the present table.

For documentation I reproduce a selection of the canons found with this table. I have seen some further ones in Vp (cf. description); London, B.L., Sloane 568,8r(15th c.; T&K 1314), Cambr., U.L., Mm.4.43(14th c.; T&K 356), Rome, B.N.Vitt.Emm., 301,2r(15th-16th c.). These are short and nondescript.

(a1) T&K 607, cf.602 with attribution to Peter taken from the secondary ascription in M8. Text from Cambr., U.L., Ji.1.17,57r(=A1; 14th c.), with variants from M8,55r.

Haec tabula docet in quo signo sit luna secundum naturalem lunationem¹, id est² de prima ad primam. Vide ergo quotae aetatis sit luna vel quot dierum, et

numerum quantitatis lunationum vel³ dierum quaere in sinistra parte tabulae descendendo; et sub illo signo directe sub mense posito – in directa linea⁴ sub mense, in quo sumus, a die lunationis vel aetatis lunae – infallibiliter sumus. 2 semis, id est dimidia⁵, significant 1 diem dimidium⁶, scilicet naturalem.

¹l.n. M8 ²i.e. om.M8 ³ne M8 ⁴l.d. M8 ⁵-diam M8 ⁶1 d.d.:
1 d. dim() A1; unum d. dimidium M8

(a2) T&K 607, cf.1553. Text from Paris, B.N., lat.7475,59r(=P4; early 14th c.). Other manuscripts: Budapest, O.S.K., 29,39r(=B2; late 14th c.); København, K.B., Thott 825,39r(not used); Kr,11v; London, B.L., Arundel 220,314v(=L2; 14th c.); London, B.L., Harley 3814,80r (=L3; 13th-14th c.); London, B.L., Sloane 514,11v(=L4; 13th c.); Paris, B.N., lat.7366,32va(=P2; 14th c.); Vatican, B.A.V., Urb.lat.507,202v (=V2; 14th c.); Wien, Oe.Nb.,2367,9v(=W2; early 14th c.).

In B2 L3 L4 P2 V2 the lunar table with the present canon forms part of a collection (cf. Wordsworth 1904,140-1; Cordoliani 1960,136) which also comprises the *Tabulae Gerlandi* (App.5(a)) and the *Tabula terminorum* (App.5(d1)); in Kr some further tables have been added, and a "tabula Dionysii" (App.5(c1)) takes the place of the *Tabula Gerlandi*. In P2 the canons to the tables just mentioned are "Tabula secunda tabula terminorum dicitur, quoniam in illa termini 5 festorum mobilium inveniuntur. . ." (also in L4 V2 Kr) and "Tertia tabula principalis Gerlandi dicitur, cuius longitudo per 28 distinctiones protenditur, quoniam cyclus solaris. . ." (also in L3 V2; about the same text in Kr, and in W,68v). The ordering of the tables varies.

I report all readings of P4, and all others except where one manuscript differs from the rest.

Haec tabula¹ docet in quo signo sit luna secundum naturalem lunationem², id est de prima ad primam. Vide ergo quota sit luna, et numerum, quem aetas lunae continet, quaere in ³exteriori linea versus sinistram³. Duo autem SS⁴ unum integrum numerum⁵ designant⁶, ita quod luna sit in primo semis dimidia ⁷et in⁸ alio dimidia⁷. Invento⁹ autem in prima linea numero¹⁰, illi respondet signum in quo ¹¹luna est in Ianuario, et sic de ceteris¹¹.

(b) Manuscript: K,56v-57r. See *Introduction* §6a.

(Hdg.): Ars istius tabulae lunae sequentis. (Txt): Ad praesentis tabulae notitiam scire debes quod luna totum zodiacum peragrat in 27 diebus et 8 horis. Moratur etiam luna in quolibet signo per duos dies naturales et 6 horas et duas partes unius horae, videlicet per 6 (*mg.*; [[.]]4 *textus*) horas integras et duas partes unius. In quolibet vero gradu secundum hanc computationem moratur

per unam horam et dimidiam et 6am et 10am et 13am ac 40am partem unius horae. In die vero naturali motus lunae est 13 gradus et 6a pars unius et paulo plus, quod est quasi insensibile. Motus autem eiusdem in dictis 8 horis est 4 gradus et 3a et 6a pars unius praeter rem modicam, quae ex dicto insensibili, quod in 27 diebus ipsius lunationis omittitur, colligitur et istis 8 attribuitur, ut facilius ad effectum praesentis tabulae veniatur. Haec autem res modica est 9a pars unius gradus, quae per aequales partes deberet attribui 27 diebus et 8 horis praedictis; sed propter confusionem, quae eveniret, relinquitur indivisa.

TABULA LUNAE AD INVENIENDUM LOCUM EIUS, VIDELICET IN QUO GRADU CUIUS SIGNI SIT,

Per hanc igitur tabulam habetur locus lunae in signis. Longitudo ergo istius tabulae 13 distinctiones sive gradus continet, quia tot gradus integros, ut dictum est, peragrat luna in die naturali. Latitudo vero eius in 28 distinctiones protenditur, in quarum ultima linea versus dextram inferius sunt 4 cellulae vacuae, quae nihil penitus operantur. Sunt enim in totali tabula 364 cellulae, sed in toto zodiaco non sunt nisi 360 gradus; et cum quaelibet cellula unum contineat signi gradum, dictae 4 ultimae cellulae vacuae remanebunt. Et nota quod ubi scribitur nomen signi, ibi est primus gradus eiusdem signi scriptus.

Si ergo velis scire, in quo signo et in quoto gradu illius signi sit luna, quaere in calendario magistri P. de Dacia, qui magis appropinquat veritati, diem primationis lunae, et considera, in quo signo et in quoto gradu illius signi fuit sol illo et eodem die primationis lunae – quod tibi per tabulas quadrantis patebit – quia luna in tali signo et in totali gradu illius signi primo accenditur a sole, in quali signo et in quoto gradu signi est sol in ipsa die primationis.

Habitis itaque die, signo et gradu, in quibus primo luna accensa fuit, idem gradus eiusdem signi sumatur in tabula praesenti, et ab illo loco computentur tot cellulae, procedendo in eadem linea versus dextram, quot sunt dies elapsi a die primationis usque ad diem, de quo quaeris; et ubi terminatur talis computatio, in tali signo et in tali gradu eiusdem est luna in initio diei, de quo

quaeris; hoc praenotato, quod ad quemlibet senarium descendes per unum gradum propter rationem praedictam, videlicet ut quilibet dies ipsius lunationis habeat 13 gradus et 6am partem unius. Et si forte non possis descendere, quia es in inferiori linea, transeas in summitate lineae sequentis, ut unum gradum addas quibuslibet 6 diebus. Nota etiam quod, cum perveneris ad ultimam lineam descendantem versus dextram, tu transibis in prima linea versus sinistram, in cuius superiori cellula primus gradus arietis situatur; ita tamen quod in transeundo cavebis, quod semper 13 gradus integros cuilibet diei dabis, et addes si necesse fuerit senario gradum unum, et iterum procedes praedicto modo in eadem linea versus dextram, donec dies, de quo quaeris, inveniatur; hoc etiam praenotato, quod ab illa hora, quae in die ipsius primationis in dicto kalendario scribitur, incipies dies tuos.

(c) Manuscript: N,69va, giving the heading "Tabula lunae abbreviata et correpta per magistrum Petrum de Dacia, correptorem huius kalendarii" and then the canon App.3(b2). The errors of N have been retained below.

Another copy of the table was printed by v.Wijk 1936,36, from Erfurt W.A.B. 4°345, without indication of its context. Van Wijk dates that copy to 1279, apparently (p.40) on the basis of a note accompanying a Grosseteste-calendar also found in the manuscript. Schum's catalogue does not yield evidence on this point.

(d) Further one-dimensional tables giving the moon's motion from its age, with degree-values "12,24,7, . . .,24,6" for 30 days as in William of St.Cloud (Harper 1966,121, canon at 123a-24) are in Bs,14v and Ro,63va (canon at 65v-66r resembling William's French canon, Harper p.221). The table of Ro also shows the series "13,26, . . .,5" known from later copies of the T.L. (*Pref.*, §22), and from the rota extracted from the *Computus Orbicularis* in Pf,53r.

Another set of values for 30 days, ending in 1°50';17(,31), occurs in Ca,148r, and Sg p.27, neither table closely connected with the Calendar. The values can be rounded to yield the series just mentioned.

(e) The 27x19 lunar tables contain lunar letters according to various series of such, cf. below. The letter with which to enter such a table is first to be found in a calendrical table, which is either separate or included in the calendar to which the lunar table is attached. The latter is the case for Peter's Calendar only in Bs, Kt, and Pe; the rest of the calendars in question happen to be later ones.

(e1) Tables with the letter series A-O spaced over 27 days (v.Wijk p.34; P.L.90,757-8; first row "a-nhc. . .") are in Bs,15r (to Peter's Calendar at 6v+), and in Bf,4v-5r (calendrical table separate). Both manuscripts also contain the T.L.

(e2) Tables with a series of 27 letters consisting of the alphabet plus four symbols conventionally denoted as z_1 - z_4 (v.Wijk p.35; first row "z₂peymb. . .") are in Kt,9r-v (to Peter's Calendar at 1v+; with a canon); Pe,30r+ (calendarial table in Peter's Calendar; no lunar table). With German calendars: Sg p.26 (to calendar at p.13+, canon p.31); Kh,154v (to calendar at 155+); Bf,13r (first row "yncvkt. . .", to calendar at 7r+); Bu,15v (first row "ashz₂pe. . .", to calendar at 16r+); Mz,132r (28 rows, first row "yncvlz₂. . .", to calendar at 116v+; with a canon); Kh,222r (same?).

(f) Various notes for finding lunar longitude by calculation: Ma,11r; Pd,37v-38r; Sg p.33; So,57r; Sx,5v.

(g) Tables giving duration of moon-light from the age of the moon: Bs,14v; Md,74r and Ml,150v (both folded); L,9v (rota, including figures of the four main lunar phases). Cf. the rotae in Kt (below); N,71v (App.6(d10)).

(h) Rotae with figures of lunar phases plus other features: Kt,8r-9r (30 phases, some without figures; giving zodiacal sign and duration of moon-light; with canon); W,69r (10 phases, short inscr. only); Mj,11v and Bu,10ra (schematic, 8 phases, as in the *Compotus* of Sacrobosco). Cf. L,9v ((g) above) and D,23r-v (App.6(d10)).

Appendix 5. Computistical additions to the Calendar and T.L.

(a) *Tables of "Gerland"*. Reproduction at p.400-1, from ms.P. See Wordsworth 1904,140-1; Cordoliani 1960,134-6. The *tabula principalis* has been printed by Cordoliani (1951,277+), and tables resembling the *contratabula* are in P.L.90,749-50 and in Steele 1926,186-7. The titles can be found in the descriptions of manuscripts. I have refrained from recording variations in the lay-out of the tables themselves.

In the following manuscripts these tables are found in close connexion with Peter's Calendar: K,45v-46r; V,67r-v; Fp,9v-10r; Cj,10v-11r; Or,133(?r)-v; G,7v-8r; P,7v-8r; Q,7v-8r; R,7v-8r; F,239v-240r; B,15v-16r; C,p.160-1; Oa,158v-159r; O,7r-v. In some other manuscripts the coherence is not close but may still exist: H,2v-3v; W,68v+70r; Ca,88v-89r; Pl,32v; Pr,25v+34r; Pe,44v-45r. In Om,43v-44r, the context seems to presuppose a calendar no longer present. In Ro,66r-67r, there is at least a canon referring to these tables.

Thus the tables occur in all of group a_1 (*Pref.* §5) and a_3 , in part of Group k, and sparsely elsewhere. They have probably been left over from the context of Grosseteste's calendar (*Pref.* §6).

The canons printed below occur as follows: (a1) K H R B F Om C Ca; (a2) H Cj Fp(text-hand, like Calendar); (a3) V Fp (both in secondary hands), Pl. Various other canons are found in F,239v; Oa,151v (?paraphrase of (a1)); Oa,158v-159r; Cj,10v; V,67r; O,7r. An extensive canon in French, in Ro,66r-67r, is not directly translated from any of those mentioned. The canon "Tabula Gerlandi cuius longitudo. . .", in W,68v and differently applied in Kr,9r+, appears to occur where the tables enter into the collection mentioned in App.4(a2).

(a1) T&K 1191. Manuscripts: K,45r; H,2v; R,7v-8r; B,15v; F,233rb; Om,43v; C,p.160; Ca,88r. Text from FB, with variants from K H. An

addition from K has been reproduced; another notable addition, "Nota, ad correctionem. . . eius quae postea sequitur", is in C Ca. The present canon appears to be that normally found with tables attached to the calendar of Grosseteste.

Quaere inter numeros in superiori capite tabulae principalis¹ positos numerum minorem propinquorem incarnationi, si incarnationem nondum² inveni-eris, et computa in illa linea descendendo, quousque compleatur numerus incarnationis; et ubi terminatur³ talis computatio, ibi erit littera tabularis. E directo litterae tabularis patet quae sit littera dominicalis, et si sit annus bissextilis vel non, et in quoto anno post bissextum sumus, et in quoto anno cycli solaris⁴ secundum Gerlandum et etiam⁵ Dionysium sumus⁶, et in quoto anno cycli concurrentium sumus. Similiter scitur in quoto anno cycli 19⁷lis, et in quoto anno cycli lunaris, et in quoto⁷ anno cycli indictionis sumus: nam littera rubea⁸ indicat⁹ primum annum cycli 19⁷lis¹⁰; angulus autem quadrati clausus rubeo designat primum annum cycli lunaris; angulus vero nigro clausus primum annum indictionis designat. Postea vero cum littera tabulari inventa intra in contratabulam¹¹, et e¹² directo eius in linea recta dextrorsum litteram dominicalem litterae tabulari¹³ concordantem, et omnia 5 festa¹⁴ mobilia, et alia nobis necessaria, reperies.

(K:) Nota quod oportet intellegere aliam litteram dominicalem in anno bissextili quam in contratabula inventam usque ad festum beati Matthiae apostoli in Febuario, scilicet litteram retrogradam proximam in alphabeto, sicut satis bene apparet in tabula Gerlandi principali.

(a2) T&K 34; Cordoliani 1960,135. Reproduction of the end of the text and the Manus *fnugonis*: Steele 1926,285. Manuscripts: Fp,10v-11v; Cj,11v-12r; H,2v-3v. Text from Fp, variants (except for numbers) from Cj H. This canon is quite common elsewhere (see the refs.). In the present manuscripts it precedes the *Compotus manualis* of Balduinus de Mardochio (T&K 42). This is also the case in Stockholm, K.B., X 767, p.16, where both pieces appear to be connected with the calendar of Grosseteste (see *Algorithm, Pref.* §1).

(Hdg., *Fp Cj*:) Incipit¹ compositio duarum tabularum Gerlandi praecedentium², et primo² principalis. (Txt, *Fp Cj H*:) Ad compositionem tabulae principalis Gerlandi 2 cycli, solaris scilicet et 19⁷lis⁴, sunt necessarii: per solarem namque habetur littera dominicalis, per 19⁷lem vero⁵ littera tabularis. Littera vero⁶ dominicalis per quemlibet 28 annorum cycli solaris habetur per 28 syllabas⁷ horum versuum:

f e d b a g f d c b a f e d c
 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
 Fons est dans bis a-gro fundum cibat aufer e-dacem

a g f e c b a g e d c b g
 16 17 18 19 20 21 22 23 24 25 26 27 28
 Augens fert escas bos aut gens e-de cibus glans,

ita quod prima syllaba ipsorum versuum⁸, scilicet Fons, servit primo anno cycli solaris, et tunc F⁹, prima littera eius, est littera dominicalis in illo anno. Secunda autem syllaba¹⁰, scilicet Est, servit 2^o anno, et E prima littera eius est littera dominicalis in ipso anno 2^o, et cetera. Semper enim prima littera primae syllabae primo anno cycli solaris¹¹, et prima littera secundae syllabae secundo anno, et prima 3^{ae} syllabae¹² 3^o, usque in finem, est littera dominicalis. Unde eadem litterae dominicales ponuntur¹³ in prima linea sinistrorsum primae tabulae Gerlandi, a summo deorsum secundum ordinem illarum syllabarum.

Manus
fnugonis.

(Fp Cj H:) Et similiter in iuncturis 7 digitorum duorum¹⁴ sinistrae manus, scilicet pollicis et indicis, ut in praescripta¹⁵ manu patet, ponantur eadem litterae dominicales sub 7 litteris ferialibus, sic: A in summo¹⁶ pollicis; B in iunctura eius media; C in radice eius; D in radice indicis; E in iunctura proxima sibi; F in iunctura proxima sub summitate indicis; G in summitate eius; et hic ordo iuncturarum semper amplius in ceteris observetur.

Per cyclum autem 19^{lem}, qui continetur per 19 dictiones horum versuum¹⁷ "Rex Furit etc.¹⁸" - ita scilicet¹⁹ quod prima dictio primo anno, secunda secundo cycli 19^{lis}, et sic²⁰ deinceps, deserviat - habentur 2, scilicet annus cycli 19^{lis} cui deservit aureus numerus, et littera tabularis. Annus cycli 19^{lis} sic habetur: prima enim dictio primo anno, 2^a 2^o cycli 19^{lis}²¹ et sic deinceps deservit.

Littera autem tabularis sic habetur. Sciendum quod 2 sunt alphabeta: primum incipit in "b" - et ponitur in secunda linea secundae tabulae Gerlandi, quae contratabula dicitur, et in manu super radicem indicis, procedendo per omnes iuncturas 2 digitorum praedictorum secundum ordinem praedictum - et finit in "v" in summitate pollicis, et est postpunctatum²². Secundum incipit in "a" in media iunctura pollicis et finit in "q" in radice pollicis, et est praepunctatum²³ differentiae causa. Unde²⁴ versus:

r f e o c b
 1 2 3 4 5 6

Rex furit elatus oculus claudendo beatus

l k t h g q e
 7 8 9 10 11 12 13

Luce kahos terret hilari gentis quatit edem

d n b a k i
 14 15 16 17 18 19

Dampnans nonne beat animas Karon inelisas.

Et nota quod, quaecumque harum dictionum terminatur in "s²⁵", est de secundo alphabeto, quae vero non, de primo. Ut igitur²⁶ habeas litteram tabularem, scito litteram dominicalem, vel²⁷ in digitis vel in linea 3^a praedictae primae tabulae Gerlandi principalis, quae sit, et eam nota. Postea vide in quoto anno cycli 19^{lis} sis, cuius tolle dictionem et vide primam litteram eius, cuius alphabeti sit et quae sit, et ipsam in loco suo in iuncturis pone digitorum²⁸. Quae si super litteram dominicalem anni praesentis ceciderit, ipsa est littera tabularis; sin autem, tunc proxima sua sequens cadens super litteram dominicalem erit littera tabularis; pone eam in loco suo in tabula Gerlandi.

Verbi gratia, pone²⁹ quod simus in primo anno utriusque cycli. Erit igitur F, littera prima primae dictionis 28 dictionum cycli solaris, scilicet Fons, littera dominicalis, quae erit in principio primae lineae praedictae tabulae, et in digitis in iunctura sub summitate indicis. "r" vero, prima littera de Rex primae dictionis 19 dictionum cycli 19^{lis}, primi alphabeti cadet super secundam iuncturam indicis, super E litteram dominicalem et non super F, et ideo non erit littera tabularis; sed proxima sequens eam in ordine alphabeti, cadens super F in iunctura sub summitate indicis, quae est "s³⁰" postpunctata³¹, erit littera tabularis, quam pone in primo quadrato 532 quadratorum³² – ex ductu 28 annorum cycli solaris³³ in 19 annos cycli 19^{lis} productorum³⁴ – et erit in directo primi anni solaris "s³⁵" postpunctata et rubea³⁶, ad denotandum quod ibi incipit cyclus 19^{lis}. (H:) Et sic operandum est de aliis, quousque omnes quadrati sint impleti etc.

(Fp Cj:) Et nota quod littera rubea indicat primum annum cycli 19^{lis}; angulus autem quadrati clausus rubeo designat initium cycli lunaris; angulus autem nigro clausus notat primum annum indictionis.

(Fp Cj H:) Et sic per omnia compones et³⁷ ordinabis compositamque verificabis tabulam Gerlandi principalem.

(Fp Cj:) Postea vero cum³⁸ littera tabulari inventa intra in contratabulam³⁹, et e directo eius in linea recta dextrorsum omnia 5 festa mobilia et cetera multa, et ante ipsam litteram dominicalem, reperies.

(a3) Manuscripts: V,68v; Fp,95v-96r. Both these texts occur as secondary additions in the manuscripts, in Italian hands of the 14th century. V contains two versions of the beginning and end of the text: the second version, appended to the main text of V, is here denoted Va. A third text is in Pl,32v+, mainly corresponding to Fp, but with many minor variants, and using the years 1352 and 1355 for 1296 and 1290 in the examples; this version has been disregarded. Since the text of V appears to be a copy of one used by a Dane, this has been followed, with variants and a few corrections from Fp.

(Hdg., *Fp*.) Incipit canon ad sciendum dispositionem tabulae Gerlandi principalis.

(*Txt*, *V Fp*.) Theorica huius tabulae Gerlandi talis est: In capite tabulae quaeratur numerus annorum domini, annumerato anno in quo es¹ vel ad quem² litteram tabularem quaeris¹. ³Quod si numerum annorum domini praecise inveneris³, tunc littera ultima praecedentis lineae⁴ versus sinistram erit littera tabularis illius anni. Verbi gratia, esto quod anni domini sint⁵ 1296: eos invenies in capite decimae lineae versus dextram computando a sinistra, et ideo littera ultima lineae nonae, scilicet "e", erit littera tabularis illius anni. Si vero annos domini praecise non inveneris,

(*V*.) tunc sic procedas, quia quaeres minorem numerum, qui tamen maxime accedit ad numerum annorum domini. Et hoc facies sic, quia invenies duos numeros immediate stantes, quorum unus minor est et alter maior numero annorum domini; et numerus minor necessario erit numerus qui inter omnes numeros ibi stantes maxime accedit ad numerum annorum domini. Quem inventum subtrahas a numero annorum domini [vel trahas in numerum], et residuum computa sub eodem numero invento descendendo; et in qua littera terminabitur numerus totalis, procul dubio erit littera tabularis illius anni.

(*Va*.) Quaere inter numeros in superiori parte istius tabulae positos unum ex illis, qui inter illos numeros maxime similis est annis domini. Si forte complete annos domini non invenies, [et]

(*Fp Va*.) tunc illum numerum, qui forsane⁶ minor est annis domini, comple et fac eum aequalem annis domini⁷, scilicet⁸ numerando a sursum usque ad deorsum; et littera illa de litteris huius tabulae, quae perficit⁹ annos domini, tabularis erit. Et diligenter consideres eam, utrum sit punctata ad dextram vel ad sinistram.

(*V Fp*): Verbi gratia¹⁰, esto quod anni domini sint 1290¹¹, et tu velis scire quae littera est littera tabularis illius anni. Quaere tot annos in capite tabulae, et si non inveneris eundem¹² numerum praecise, quaere ergo minorem, propinquiorem tamen, et erit 1268¹³, ¹⁴qui proximior est numero annorum domini¹⁴. Deinde hunc numerum ab annis domini subtrahas, et remanebunt¹⁵ de annis domini 22¹⁶, quos computes descendendo sub numero illo primo¹⁷ invento; et terminabitur totalis numerus super "n¹⁸", quae erit littera tabularis illius anni 1290mi¹⁹,

(*V*): qui est annus primus consecrationis domini Iohannis dicti Grand, archiepiscopi²⁰ Lugd().

(*V Fp*): Inventa autem²¹ littera tabulari, vadas e directo eius²² ad ultimam lineam versus sinistram²³, et invenies 22²⁴, quae significant annum illum, cuius invenisti litteram tabularem e directo, 22m²⁵ cycli solaris secundum Gerlandum et veritatem²⁶. Deinde e directo eiusdem litterae tabularis

(*V*): vadas ad ultimam lineam versus dextram, et (*Fp*): in 3a linea sinistra invenies 11 ad significandum quod annus ille, invenies 2^o pro concurrente. cuius invenisti litteram tabularem, est 11^{us} annus rente. cycli solaris secundum Dionysium et usum ecclesiae.

(*V Fp*): Deinde e directo eiusdem in 4a²⁷ linea invenies "a²⁸", quae est²⁹ littera dominicalis illius anni; et quia ipsum "a²⁸" per duo puncta distat in sursum a nota bissexti, quae ponitur in 3a³⁰ linea, ideo annus instans est 2us³¹ post bissextum. Rubeae autem litterae, quae sunt in 3a³² linea, sunt elisae per bissextum.

(*V*): Ad cuius intellectum sciendum est quod, si littera dominicalis inventa aliquando per litteram tabularem fuerit littera versus dextram notae³³ bissexti, tunc annus ille erit bissextilis, et tunc littera illa erit dominicalis a festo beati Matthiae usque ad circumcisionem; littera autem stans versus sinistram pro anno erit littera dominicalis a circumcisione usque ad festum beati Matthiae.

(*Fp*): Verbi gratia, si littera tabularis concordat cum illa rubea quae est in 6a linea, tunc annus ille erit bissextilis, et tunc littera illa erit dominicalis a circumcisione usque ad festum Matthiae; littera autem stans versus sinistram in 5a linea pro anno erit littera dominicalis scilicet a festo beati Matthiae usque ad circumcisionem. Et similiter illa B rubea, quae est in 4a linea versus sinistram, dicit quod est annus bissextilis.

(*V Fp*): Quo facto videas quota est littera tabularis a cellula insignita angulo nigro inclusive, quia totalis est annus ille indictionis, ³⁴et cum 3^o anno praeecepto 1290mo³⁴, quia ille angulus niger attestatur³⁵ primo anno indictionis³⁶. Item videas quota est littera tabularis ab³⁷ angulo rubeo, quia totalis est annus³⁸ instans cycli lunaris. Deinde videas quota est littera tabularis a littera rubea, quia totalis est annus instans cycli 19'lis, ³⁹et est ad praesens 19us vel 2us³⁹: rubea enim littera semper attestatur primo anno cycli 19'lis. Et nota⁴⁰ quod, quantum de cyclo 19'li praecesserat, etiam inclusive, tantum semper est⁴¹ pro aureo numero in kalendario. Item nota quod, ad sciendum

quotus annus cycli lunaris sive 19^lis vel etiam indictionis fuerit, computandum est semper sursum ascendendo a littera tabulari, annumerando tam cellulam litterae tabularis quam cellulam quae est⁴² initium cycli cuiuscumque⁴³; et istud nota diligenter.

(V:) Qualiter autem per hanc litteram tabularem inventam invenientur omnia festa mobilia anni instantis cum quibusdam aliis ad annum pertinentibus, hoc iuxta contratabulam dicetur. Si autem velis scire, quota epacta fuerit omni anno, scias quota fuerit luna 11. Kalendas Aprilis, quia totalis erit epacta in illo anno.

(Fp Va:) Et⁴⁴ quando hoc fecisti, tunc scias duo alphabeta, quae ponuntur in secunda tabula, quae dicitur contratabula, et in secunda linea; cuius unum habet punctum ad dextram, scilicet primum⁴⁵; sed⁴⁶ secundum habet punctum ad sinistram⁴⁷. Et tunc littera tabularis <b.> concordat cum littera dominicali D⁴⁸. Et docet te⁴⁹ festa mobilia⁵⁰ et alia, quae quilibet clericus necessario scire debet⁵¹.

(Va:) Scilicet annum bissexilem, cyclum 19^lem, lunarem, cyclum solarem, annum indictionis. Nam littera rubea cyclum primum 19^lem significat; rubeus vero paragraphus Γ annum lunarem significat; niger autem paragraphus Γ annum primum indictionis significat, etc.

(b) The *tabula 5 festorum mobilium*, and *rotae* for golden number and Sunday letter etc. Reproduction at p.408-9. For a previous print see description of ms. Mt. When appended to the Calendar, the table is usually accompanied by at least two *rotae* (19 and 28) for golden number and Sunday letter. Some instances of these depart from the year 1301, as in M,9r-v; X,2v+10r; Re,7v-8r; or apparently from 1300,

App.5(b), from M,9r. Typography arbitrary.
One correction applied apart from those shown.

App.5(b): rotae from M,9v, emended.
 Canons inscribed, see App.5(b1).

as W,57r+58r, cf. Pl(below). The rest show later dates, some of which may be continuations from the year 1301: thus, T,188r (1339 for both rotae); Ly,14r-v (1339); So,45v-46v (1358 and 1357). Others: D,16-17 (1340,1328); Mj,9r+10v (1330); Mt p.247 (1332); Bv,17r-v and Mk,9r-v (1368); Md,72v+75v (1371; rota possibly independent of table); Kt,7v-8r (1484); Pd,65v-66r (undated). In the context of the Calendar, the table without rotae has been found only in Ma,3r. On the whole, the table is common in those, mainly French, manuscripts of the Calendar which belong to Groups b₁, c, and d (*Pref.*, § 5), and has further been found in D and TW.

The canons on the table vary much. One of them has been earlier printed, from Mt (see description). A recurring one, in M Bv Mk So, is reproduced here as (b1). Others occur singly in Re,7v-8r ((b2) below); D,17r-v; Md,72v; Ma,3r; E2,64r(cf. just below).

The table is found in the company of other calendars in E2,64r+70r (calendar, (j4) below; also with the T.L.); in Bf,14v-15r (with rotae, to calendar (j9) at 7r+, starting 1425); and in Cd and Ny (calendar,

(j7)). Tables on the same principle, but with fewer sub-tables, are in Md,73v; Bu,15r (rotae at 14r); Bf,4r; Sg p.28, part of them with other calendars.

In default of material for guessing at the origin of the table, one may briefly observe that it has much the same sub-tables as the *Contratabula Gerlandi*, and that the method of entering it is equivalent to one used in finger-reckoning: indeed, in H,7r (early 14th c.) an analogous table, containing Ciziojanus-syllables for the dates of the five feasts, has been introduced to illustrate Balduinus' *Computus manualis*.

Independent *rotae* for different computistical variables are in P1,8v (departing from 1300), 27r (1351); A,13r (1324); W,60r (1324); Oa,158r (1330); Md,78r (1360); M1,150r (1370); L,1r-v (undated). A longish canon, "Utilitates trium rotarum", is in A,12v and Om,45rb; samples of other titles and canons to these *rotae* can be found in the descriptions.

(b1) Manuscripts: M,9v; So,45v-46v; Bv,17r-v; Mk,9r-v. Text from M, with variants from So. The section concerning the table is common to all four mss.; the canons to the *rotae* are recognizably similar in M So, whereas Bv Mk construct a composite *rota*, with a canon referring to the table. The canons in So have been reproduced in the order followed by M.

Ad sciendum¹ festa mobilia per numerum aureum² et per litteram dominicalem. Notandum quod³ primo quaerendus est aureus numerus illius anni, de quo quaeris; deinde quaere litteram dominicalem proximam sequentem⁴ aureum numerum; et haec littera dominicalis in sua linea directe dirigit⁵ te secundum rubricas suprapositas⁶. Et si eadem littera, ubi aureum numerum illius anni⁷ inveneris, est littera dominicalis, tunc require alteram⁸ litteram dominicalem proximo sequentem, et haec⁹ secundum rubricas te dirigit¹⁰. – Verbi gratia, esto quod aureus numerus sit 7¹¹ et littera dominicalis B¹²; dies LXX erit 30. die Ian.¹³; dies XL 20. die Febr.; dies paschae 3. die Aprilis; dies rogationum 8. die Maii; ¹⁴dies pent. 22. die Maii¹⁴; hebdomadae a nativitate domini usque ad XLam 8, dies 1¹⁵; hebdomadae a pent. usque ad¹⁶ Ioh.¹⁷ 4, dies 5; ¹⁸et ubi ponitur punctum¹⁹, nulla dies excrescit ibidem¹⁸. Item²⁰ hebdomadae a pent. usque ad adventum²¹ 27²². Et sic notitiam habebis tabulae suprapositae²³.

(M,rota(28):) Ad inveniendum litteram dominicalem et litteram bissextilem per (So:) Ad inveniendum litteram dominicalem et bissextilem per

annos domini, incipiendo in anno domini millesimo trecentesimo primo, et sic computando usque complete invenias annos domini, et illa littera est dominicalis; rubra autem infra erit in bissexto.

(Rota(19):) Ad inveniendum aureum numerum, id est cursum lunae, per annos domini, incipiendo supra in 10, sic: "millesimo trecentesimo primo", et sic versus dexteram computando; et ubi annos domini compleveris, in eadem sphaerula aureum numerum illius anni invenies, et sic procede perpetuo computando.

(Rota(15):) Ad inveniendum indictionem cuiuslibet anni per annos domini, procede per modum sphaerularum suprapositarum, donec complete invenias annos domini.

(Rota(19):) Ad inveniendum numerum epactarum cuiuslibet anni per annos domini.

(Rota(7):) Concurrens cuiuslibet anni per litteram dominicalem, incipiendo a Kal. Martii.

annos domini, incipiendo millesimo trecentesimo lvii^o, et sic usque compleas annos domini, et ibi plane erit.

Ad inveniendum aureum numerum cuiuslibet anni per annos domini, incipiendo sic: "m^occc^olviii^o", et sic usque compleas annos domini, et ibi plane invenies aureum numerum illius anni de quo quaeris.

Ad inveniendum indictiones cuiuslibet anni per annos domini, incipiendo sic: "m^occc^osexagesimo primo".

Ad inveniendum numerum epactarum per annos domini in quolibet anno, incipiendo m^occc^olv^o et sic numerando usque ad finem, et invenies. (The rota has 18 sectors, lacking that containing zero).

Concurrentes cuiuslibet anni a kalendis Martii. vii.

(b2) Manuscript: Re,7v-8r. Accompanied by two inscribed rotae (19 and 28), for which see the description of Re.

(Hdg.): Ch'est a sauoir le cours de la lune et la letre du dimenche et quant il est bissexe et les 5 festes mouables qui ne sont pas ou kalendier. (Txt:) Se vous volez sauoir par quel nombre la lune keurt, queres en la roe ou le

nombre de la lune est escrit, 1301, et vous le troueres en contre le nombre de 10; ch'est a dire que quant les anz nostre seigneur estoient 1301, le cours de la lune estoit X. Et deves conter chancun nombre pour une anne vers destre. Et le nombre qui parfera les anz nostre «seigneur» ou vous seres, sera le nombre du cours de la lune toute sele annee; et en cele maniere aures le cours de la lune a touiours mes.

(Hdg.:) Les dimenches. (Txt:) Pour sauoir par quel lettre li dime<n>ches keurt, queres en la roe ou les lettres de dimenches sont escrites, 1301, et le parfaites des lettres qui sont desous escrites, en contant vers destre, et chancune lettre pour une annee. Et la lettre qui parfera les anz nostre seigneur ou vous seres, sera la letre du dimenche toute sele annee. Et s'il est ainsi qu'il i ait une letre rouge en contre sele mesme letre, vous direz que vous estes en l'an de bissexe, et courra la letre rouge de la circoncision de q(ue) la S. Mathieu, et la letre noire courra de la saint Mathieu de q(ue) la circoncision; et le b' feru parmi senefie les bissextes.

(Hdg.:) Les festes mouables. (Txt:) A trouer les 5 festes mouables prenes le nombre de la lune en la premiere ligne de vostre table, et en la seconde ligne troueres la letre du dimenche de l'annee ou vous estes, procheine au nombre de la lune, et q(uen) ele soit au desous d'ou nombre de la lune. Et quant vous aues la letre du dimenche trouee, ales en l'encontre de cele letre vers destre, et descendes de sous quel que feste que vous voures auoir, et le nombre que vous troueres en contre la letre de vostre dimenche vous dira quant iours la feste sera dedenz le mois que vous troueres de sus escrit; et si troueres en contre cele mesme letre les semeines et les iours du noel de ques a la septuagesime, et les semeines et les iours du noel au quaresme, et les semeines et les iours de pentecouste a la feste S. Jehan, et les semeines de la pentecouste de ques aus auenz.

(c) 28×19 tables other than the *Tabula Gerlandi*.

(c1) Tables named *Tabula Dionysii*, using tabular letters and with counter-tables like the *Tabula Gerlandi*, are in V,59v-60r (years 1063-1567 shown by upper entrance row; first row "bhbpqbp. . ."); Md,76v-77r (1064-1568; body of table same as V); Ml,148v-149r (1372-1512; segment of a table like that of Md). The table printed in *P.L.*90,747-8, has the same contents as these, except that rows and columns have been interchanged.

Tables with other starting-years are in Kr,7v-8r (1139-1643; body of table like the "Tabula Dionysii vel magna", v.Wijk p.134) and in D,19r-20v(988-1492), both of them with canons.

The counter-tables contain at least the dates of the five moveable feasts, and some other sub-tables which are mostly also in the *Contratabula Gerlandi*. A loose counter-table in Pr,30r. None of all these tables, except that of D, appear closely connected with the Calendar.

(c2) A set of tables with a different series of tabular letters: O4,71v-72r. An 28×19 "Tabula paschalis" (1029-1533, with Easter dates): X,1v.

(d) Other tables of feast-dates and intervals, etc.

(d1) The *tabula terminorum* (Cordoliani 1960, 136 and n.109), has 19 rows, one for each year of the 19-year cycle, and at least 5 columns in its body, for the limits of the moveable feasts, starting with Kal.Feb. It is attached to the Calendar in K,44v-45r and Kr,7r, and is found with the T.L. in Om,43r and Pc,57r. It earlier accompanied the calendar of Grosseteste (e.g. in M8,55v) and/or the Tabula Gerlandi or similar paschal tables (e.g. in K Kr Om; cf.App.4(a2)). The common canon "Haec tabula (prima) dicitur. . ." (T&K 607; 1553?) is in K Kr M8.

(d2) The *tabulae fnugonis* (7×5 and 7×6, containing tabular letters which form the word "fnvgo" in their fifth and first rows) serve to find the interval Christmas-40^a. Printed in Steele 1926,285, and v.Wijk 127-8, from the appendix to Alexander de Villadei's *Massa Compoti*. Cf. Cordoliani 1960,137. One or both tables are found with the Calendar in D,21r-v; Kr,7r (with canon); Pl,27r; Mf,7r.

(d3) The *tabula Bedae* (19×7, with tabular letters, first row "vabcrst"). Printed in Steele 1926,287, and v.Wijk 128, source as for (d2). Near the Calendar in K,45v (later hand); D,21r-v; Kr,8v; Mf,7r; and with the T.L. in Pc,58v. D and Kr show different canons.

(d4) The *tabula angeli* (19×7, with tabular letters, first row "nasuleg"). Cordoliani 1960,128-9; v.Wijk,129 and plate facing; a similar device in P.L90,743. In Kr,8v (with canon); W,68r. In Kr and W the table is accompanied by a rota (7) giving lunar ages at the five moveable feasts when entered with one of the letters "angelus" from the table. W,68r-v has a *tabula fortune* with a rota on the same principle.

(d5) Tables of the *interval Christmas-Invocavit (40^a)* (19×7, with numbers between 6 and 11 for the weeks elapsed). Cordoliani 1960,133. With the Calendar in Bs,16v; Md,75r; other contexts, E2,71v; Pc,58v. A similar table, with number-symbols resembling jellyfish, is at W,60v. The *tabula taxillorum* (19×11), for the same interval, is in Md,75v; Sg p.28, each with its own canon. Interval table *Christmas-Estomihi* (19×7, with numbers 5-10) in Bf,14r.

(d6) Various other tables: 19×7, mostly with Easter dates, in Ca,148r; Lr,31r; Pd,65v; Pf,54v; and Ca,42r (19×12). A 7×8 table, with dates for 8 Sundays "In

principio, Si bona, . . ., Aspiciens(=Advent)" and the verses "post festum terne regum. . ." (Walther 14314) is in W,69r and Mz,134v. The "magna Bedae tabula" (e.g. M8,54v, with calendar of Grosseteste; Cordoliani 1960,132) has not been found in relevant contexts.

(e) Lists of computistical variables for successive years (cf. Cordoliani 1960,119) may be tables or rotae covering a single cycle of some variable, such as (d1) or (b) above: further instances in (e1). Lists of varying lengths, in some cases multiples of such cycles, are exemplified in (e2).

(e1) Lists of *Easter limits* for 19 years, with dates like those found in (d1) above, beginning "post nonas Aprilis prima dominica fac pascha" or similarly (Cordoliani 1960,114(c); *id.* 1961,199). In B,8v; Sc,47v (both with Calendar, secondarily in B); Pc,57r; M,9v; Pr,30v. The heading in B, "hic est terminus paschae qui numquam in bissexto praeterit nec sine bissexto", has similar counterparts in Sc Pc.

A rota for "*pascha Hebraeorum/Iudaeorum*" during 19 years, giving the same Easter limits as above, is found with the Calendar in K,40r (secondarily); D,22v (title "tabula angelica", also in N,28r); and in Pr,32r (context uncertain). The rotae of K and Pr are ordered according to the dates (with an omission and slide in K) and have approximately the same canon, which in K runs "Si quis scire voluerit hanc rotam, accipiat numerum aureum illius anni, et quaere in circumferentia huius rotae, et in directo illius numeri erit pascha Hebraeorum in kalendario, et in sequenti dominica celebrabitur pascha nostrum. (K only:) Rota haec inventa fuit anno domini m^occ^olx^oij^o et habebit decurrere usque ad dclclxxxiiii annos". The rota of D is ordered according to the golden numbers, and has a different canon. At V,58v, there may be a similar rota, dated 1277, with one further canon.

Other single-cycle lists of variables, more or less connected with the Calendar, are in Mj,10v; Ml,149v; St,24r; Sg p.36. Sets starting with 1401 are in Sg p.27 (to calendar (j9) below) and T,181v (secondarily).

(e2) Lists of variable lengths and contents are in L,10r; Fl,1v; Ba,148v; Md,76r; Bs,13v-14r; Bu,14v; Bf,14r. Extensive lists of Sunday letters and golden numbers occur with the English calendars (j7(-8)), as in Cd,13v-14r; Lr,31r; Ny,2v(9v).

(f) Computistical verses and canons occur in plenty, with the tables of the Calendar or separately. In (f1) I note a selection of verses, and in (f2) some other pieces, without any attempt at completeness.

(f1) Verses, except those occurring only once in later manuscripts (for the latter see, e.g., Pe,25v; Oa,152v; Pd,37v; Ml,144v,149v; E7,1r; X,10r; W,57v, 61r,61v+; Mg,163r; Ef,199r; Wu,2v+; Lr,31r; Kh,151r; Sg,p.33-6; Md,75r). A few common verses from elsewhere in the present appendices are also included. In the following, "MC"=verse in *Massa Compoti*, v.Wijk 1936; "PL"=Patrologia Latina vol.90; "C0"=Cordoliani 1960; "C1"=Cordoliani 1961. The verses are generally in Walther.

(f2) Other canons: Short rules for finding 70^a,40^a and Easter, "Nota quod a 16.Kal.Febr. usque in 16.Kal.Martii, ubicumque luna x^a occurrerit, dominica quae sequitur est septuagesima", etc., are in Fp,96v. A similar but differently phrased canon: K,41v (secondary hand, as the Kal.canon B preceding). K,44r, also has a note on Advent in a late hand.

Rota (12) for unlucky days: Ml,152r. Month-pictures have been found only in the calendar of Mj,3r+, illustrating the verses "Poto, . . ." above.

(g) Solar tables.

(g1) Tables of solar longitude. See *Introduction* §5b for the attempts to attribute such tables to Peter Philomena, and *Pref.* §17 for the tables found in the Calendar and for the separate tables in K,46v+ (Will. of St.Cloud) and S,21r (from Calendar). An alternative table within the Calendar is in Pd,59r+. Separate tables, more or less loosely attached to the Calendar: Pc,57r; Ba,148r; Ba,149r (Jo. de Muris); Md,78v-82r. No striking similarities between the tables mentioned have been found, except that those of Pc and Ba,148r are almost identical. Various canons occur in K,45rb (from the *Quadrans Vetus*) and in Pd,58r; see also App.1(a).

(g2) Tables of meridian altitude of sun for each day of a year. See *Pref.* §15 for the sub-table *Alts* within the Calendar; its variants should be sought there and in the descriptions. Separate tables are in Ba,149v (?extract from Calendar); Ro,67v; Pd,57v; Pe,24r, for varying latitudes. In Pe and possibly in Ro (64v) they are accompanied by canons for finding time of day from solar altitude; another such is (h1) below.

(g3) One or both of William of St.Cloud's tables for the sun's entrance into the zodiacal signs (one of them for each month of 4 years, dated to 1296, first value March 12^d2^h; the other a "tabula perpetuae aequationis. . ." with time-corrections at 5-year intervals starting in 1296; cf. Harper 1966 p.129+132) are in Ba,148r and Bs,14v+16r. Two other tables, both of them for 1 year: W,69r; Ba,152r. A rota for the same purpose is said to be in Oa, 160+.

(h) Various other additions.

(h1) T&K 1478, from Zinner 1925,8875. Finding time of day by means of the Old Quadrant. Text from M,2v; variants from Pl,8v and Mj,2r. Other witnesses: Bf,13v; Ef,198v; O5,235v; Pe,24r; Tr,252r; W,59r. Appended to Kal.canon B in M P1 Tr Ef, and to Kal.canon B+T.L.canon in Mj; for the other contexts see the descriptions. Headed "Ad sciendum horas diei per quadrantem" in Mj O5 Tr Ef. Wording similar to the Tractatus Quadrantis §46 (Tannery 1922 p.173) and to William of St.Cloud, Harper 1966 p.150-1. The relations among the witnesses here cited are obscure except for the fact that Tr Ef have a couple of errors in common. This piece is cited by Zinner only from Wolfenbüttel, Herz.Aug.B., 65. Aug. 2°,232r. It is there added to some version of the Practica Geometriae.

Si volueris scire horas diei per quadrantem, primo debes scire in quo mense es (*om.*Mj) et in quo die eiusdem; et his cognitis (*visis* P1) scias elevationem solis, et pone perpendiculum super tot gradus in limbo quadrantis, et postea trahe margaritam super ultimam lineam (*s.u.1. om.*P1) versus manum dextram, et fac radios solis transire per ambo foramina duarum tabularum; et margarita ostendet tibi horam, quia si cadit super primam lineam versus manum sinistram (*dextram* Mj), erit prima hora (*h.p.* P1), si supra (*super* M) secundam, secunda, et sic de aliis.

(h2) The *horologium viatorum*, for finding time of day from measuring a man's shadow by his feet, may ultimately be from Palladius, *de agr.*II. It usually consists of six tables, for the month-pairs Jan/Dec, Feb/Nov, . . . , each of them giving shadow-lengths, for each hour of a day or for the hour-pairs 1/11, . . . ,6 (example in *P.L.*90,447-8). Such tables occur in Md,74v (=Md₁); Ba,148v (with ref. to Palladius); Fp,2r (7 tables since the months are paired otherwise). Semi-circular tables with all 12 months separate (example in *P.L.*90,953-4) are in Md,83r (=Md₂) and Ml,150r. In N,69va, the values are written out in a list. Excerpts:

	Fp	Ba	Md ₁	N	Md ₂	Ml	Palla dius	PL 90, 447	PL 90, 953
January, 1st hour	27	24	28	29	19	19	29	29	29
March, 6th hour	5	5	7	10	8	8	5	7	7
June, 6th hour	2	2	1	1	2	2	2	1½	1

The differences may be mostly due to scribal errors.

The "ars cylindri" of Fp,1r, uses the same principle but has other units of measurement.

(h3) Other instruments: Luni-solar volvelle, as on the back of the New Quadrant (cf. Bober 1948, p.28 and Plates 7b,8e-f; Gunther 1922,234ff.); W,68r; Od,53v (canon at 54r); another such, or just a zodiac circle, in Pn,13v. The Directorium of William of St.Cloud: Om,45ra. Astrolabe: Bs,17r-v. For others cf., singly, N,71rb-va; O4,57b; Ro,64v; and (h1) above on the Old Quadrant.

(h4) Astronomy: Tables or figures of climates: Fp,96v; V,59r; L,10r; Od,52r. Maps of world and/or spheres: Mj,12v; Pr,29r; O,1r; Md,82v; Bf,6v. Diagrams including spheres: V,60v; N,71v; Tr,252v.

(h5) Astronomical constants: "ordo quantitatum corporum caelestium", Mj,27r. Lunations: K,38r; Pc,58v; Bs,16r; Fp,94v; none of the values are identical. Mean motions: Pr,34v. On the common time-units: Sc,40r; O,1v; Md,74r.

(h6) Arithmetics: Table of positional notation of numbers, up to 10^8 : D,18r-v; Md,76r; to 10^9 , Kh,153r. Tables of correspondence between Arabic and Roman numbers: Ro,68r (1-76); Ny,2r(9r) (1-90,100-500, 1000-10⁶; in canon to the calendar (j7)). Triangular table of multiplication, 60×60: Pc,57v-58r, no doubt connected with the tables of Jo. de Lineriis.

(j) Other calendars, and lists of eclipses.

The present section is meant to draw attention to such other calendarial works as may have interacted with the tradition of Peter Philomena's Calendar. The list is incomplete due to insufficiency of my records and means of identification. Generally, I furnish excerpts meant to help identify the pieces when occasion allows. Where possible, the readings are those shown by a majority of the witnesses cited; they have not been otherwise checked.

(j1) *Calendar of Grosseteste*. 4 cycles of conjunctions, 1208-1283 (Lindhagen, below).

Jan. 1	t 2	-	t 14	t 8
Jan. 2	h 21	h 15	h 9	
Dec. 30	l 13	l 7	-	l 19
Dec. 31	-	t 20	l 1	-

The conjunction table has been edited and analysed by Lindhagen (1916), together with three canons, one of which is App.1(d). The calendar appears to be commonly accompanied by the Tabula Gerlandi (this App., (a)), the Tabula lunae (App.4(a)), and by some of the tables in (d) above. It was argued in the *Preface* (§6,7,10) that it forms the sub-stratum of Peter's Calendar, at least in the manuscripts of Classes *k* and *a* (*Pref.* §5). Note also that in M8,56r+, elements from William's and possibly Peter's calendars have been grafted on it by some secondary hand; and see *Pref.* §17 for a similar case.

(j2) *Kalendarium reginae* of William of St.Cloud. One cycle of conjunctions, 1292-1310. For the values see *Intr.* §21.

Jan. 1 -
 Jan. 2 *t* 2' (=A.D.1310, hour 2 after noon)
 Dec. 30 *r* 4'
 Dec. 31 -

Edited, with the canon "Testante Vegetio" and a French version of it, by Harper 1966. The conjunction table has been juxtaposed with Peter's in Cj,4v+; Oc,38v+; Re,1v+; Cj and Re have canons. In Pl,15r+, the two calendars are adjacent, each in their own frame-work. As was seen in the *Preface*, §15-6, the sub-tables *Alls*, *Qdie*, and *Qnoc*, commonly occurring in manuscripts of Peter's Calendar, have been borrowed from William's. Various other instances of mixture of the two calendars can be found in Bs,12v (canon for William's, adapted to Peter's); Ro,64v+(various texts intermingled); and cf. (g3) for Ba and Bs, (j1) for M8 (with extract from canon, Harper p.96+); (h1) for another possible excerpt from the canon reproduced by Harper; and App.4(d) for the lunar table from that canon.

(j3) "*Kalendarium. . .compositum a fratre Rogero Bacoun*". 4 cycles of conjunctions, 1292-1367.

Jan. 1	19 1 ^h ;2	-	19 10; 9	19 2;22
Jan. 2	8 21;12	8 13;44	8 6;17	8 22;51
Dec. 30	10 12;22	10 4;54	10 21;27	10 14; 1
Dec. 31	-	18 17;36	-	-

See Wordsworth 1904,137, and T&K 805. In O4,58r+, with a canon stating that the figures have been calculated in 1289 from the Toledan Tables and for the meridian of that city, and that some sub-tables are valid for the latitude of Lincoln. In fact the values correspond to those calculated from the Toledan Tables (*Intr.*, §21), except that they appear to have been entered one day earlier, in accordance with the canon "incipiendo a meridie diei quam habes" (O4,58r). See the references above for two further manuscripts; a third one is Ew,73+, without a canon. The copy in O4 has taken over the T.L. and an extract from Kal.canon B.

The calendar ascribed to *R(aimund) Bancal O.F.M.* occurs together with Peter Philomena's Calendar in N,57v-63r+71r. It has 4 cycles of conjunctions. The canon states that it covers the years 1311-1386 and has been calculated from the Toledan Tables, as is also evident from the following excerpt,

Jan. 1	-	<*>	<*>	-
Jan. 2	8 13;45	8 6;18	8 22;52	8 15;25
Dec. 30	10 4;55	10 21;29	10 14; 2	10 6;35
Dec. 31	<1>8 17;37	-	-	<1>8 19;16

The values in cycles 1-3 fit those of cycles 2-4 above, to within some 3 minutes.

(j4) A calendar with 4 cycles of conjunctions, for the years 1311-1386,

Jan. 1	-	19 17 ¹ / ₃	19 9 ² / ₃	19 2 ¹ / ₃
Jan. 2	8 20 ¹ / ₃	8 13 ¹ / ₃	-	8 22 ¹ / ₃
Dec. 30	10 11 ² / ₃	-	10 20 ³ / ₃	10 13 ² / ₃
Dec. 31	18 14 ² / ₃	10 4 ¹ / ₃	-	-

is in E2,64r-69v. The canon, at 63r, stating that the calendar was made in 1313 by a Praemonstratensian, has adopted the letter table of Kal.canon B. The T.L. is attached to the calendar.

(j5) Calendar of <Walter of Elvedene>. 3 cycles of conjunctions, 1330-1386 (cf. below).

Jan. 1	-	19 21;54	19 22;51
Jan. 2	19 3;56	-	-
Dec. 30	2 5;50	2 7;57	2 5;11
Dec. 31	10 14;59	10 14;59	10 15;33

Occurs as a later addition to Peter's Calendar in C,147+, and separately in P1,(21r-)26v. The present attribution rests on a note in C implying that the calendar covers the years 1330-1386.

A calendar ascribed to Walter occurs at the beginning of ms. Lo.

(j6) Lists of solar and lunar *eclipses*, beginning in 1330 or later and ending in 1386, have been attributed to Walter of Elvedene (e.g. Zinner 1925, no.10890 with p.512, cf. no.5334-9 with p.445). Most of them contain values of times, magnitudes, *casus*, *mora* (lunar eclipses), and durations. Excerpts from the two last entries in each list:

		time	magn.	duration
<i>solar</i>	1384 Aug. 18	1 ^h ;18,1	10 ^P ; 0,0	2 ^h ;5,42
	1386 Jan. 1	22;36,26	7;36,52	1;55, 4

<i>lunar</i>	1385 Jan. 27	15;4,20	18;12,38	3;24,14
	1386 Jan. 16	16;27,35	9;12, 8	3; 2,36

Such lists occur with the calendar (j5) in the manuscripts C,147+ (distributed over the months in question and discarding the second-values in most cases); P1,7r-v (with a canon); Lo, ending at 9v. In more or less close connexion with Peter's Calendar they are found in Pd,66v+;Tr,261v;Pr,25r;Mj,11r; in the two last cases the lists have been merged and truncated at the end, but the remaining values are the same as elsewhere. Abbreviations are found severally in Md,77v (dates and hours only, much miswritten) and Ml,148r (lunar eclipses only, times different but durations as above, no second-values). Lists with dates one day lower (so that "Jan.0" occurs) and without second-values are in E2,72r-v (canon at 63r-v resembling that of P1 but noting that the dates are to be taken as elapsed; with calendar (j4)) and W,69v (with Peter's Calendar).

(j7) Calendar of *John Somer*, and cognates. Some of the 5 cycles of conjunctions

Jan. 1	19 21;45	-	19 23;49	19 7;53	?
Jan. 2	-	19 14;27	-	-	?
Dec. 30	10 9;59	2 2;21	-	10 16;18	18 11;24
Dec. 31	-	10 21;24	10 4;59	-	7 21;35
Cycle:	I	II	III	IV	V
	(1387-)	(1406-)	(1425-)	(1444-)	(1463-81)

are found in Ny,1r-15r (cycles I-IV); Cd,2v-13r (II-V); Bo,168r-173v (II,headed "secundus", regular entries only from year 11 (=1416) on); Pr,15r-21v (III-IV). Ny and Cd also have cycles of oppositions. In Pr the calendar has a canon (T&K 43) ascribing it to John Somer, and the canon of Ny "ad notitiam tabularum" is also attributed to that author (T&K 55).

In Pr the calendar follows upon that of Peter Philomena, with considerable confusion of their accessories. In Ny and Cd, as in Pr, it has adopted the T.L. in varying versions (*Pref.* §22). In Bo it has supplanted Peter's cycles of conjunctions, the rest of the context remaining intact. The texts appended to these calendars seem typically to include the table (b) above and the lists mentioned under (e2) and (j8); but the evidence available was not sufficient on this point nor as concerns the relationship of the present calendars with that of Nicholas of Lynn.

(j8) Lists or inscribed figures of solar and lunar *eclipses*, beginning in 1387 or later and ending with 1462, occur together with the calendars of John Somer or Nicholas of Lynn (cf. Zinner 1925, nos.6667-98 with p.466). The lists furnish values analogous to those of (j6) above. Excerpts from the three last entries in each list, mainly following Ny:

<i>solar</i>	1453	Nov. 30	1h;25,46	9p;59,30	2h;5,45
	1460	Jul. 18	14;42, 0	7;29,47	1;53,34
	1462	Nov. 20	23; 0,15	1; 9, 1	1;53,40
<i>lunar</i>	1461	Jun. 22	6;46, 8	20;16,48	3;48,12
	1461	Dec. 17	1;38,10	12;55,29	3;25,40
	1462	Jun. 11	12;35,21	6;47,53	2;46,24

Such series are found with the calendars (j7) in Ny,20r-21r (lists) and Pr,28r-v (inscriptions to figures, with ascription to John Somer). In Lr, ending at 30v (figures) and Ln, ending at 32v (tables), the lunar series is found with the calendar of Nicholas of Lynn. In these two cases the times differ from each other and the excerpts above, and the dates are generally 1 greater; but the magnitudes and/or durations remain recognizable. Here as in (j7) the calendars, with eclipse lists, have been noted since they are accompanied by versions of the T.L.

The notes on solar and lunar eclipses in the Calendar of Bs (6v+), which end in 1462, yield dates+hours generally 1^d+1^h greater than those above.

(j9) Calendar of *John of Gmunden*, and other Austrian or German calendars. The cycle numbers in these seems generally to be the golden number; thus, the cycle numbers are mostly not in chronological succession within a cycle, and even where calendars show comparable values, some of these may appear shifted between adjacent cycles.

Four of the six cycles of conjunctions

Jan. 1	-	19	5;10,53	-	-	8	19;28	-			
Jan. 2	8	1;19,59	8	17;51,54	8	10;23,49/24	8	2;55,44/56	-	8	12; 0
Dec. 30	10	16;29,53	10	9; 1,46	10	1;33,42/34	-	10	10;38	10	3; 9
Dec. 31	18	12;38,59	-	18	21;42,48/43	18	14;14,43/15	18	6;47	18	23;19
Cycle:	I	II	III	IV	V	VI					
	($18''=1404$)		($15''=1439$)								

are found in each of the manuscripts Sg p.14-25 (cycles I-IV, beginning in 1404, values to seconds; Zinner 1925,5364, sole instance) and Bf,15v+ (cycles III-VI, also for oppositions, beginning in 1439, values to minutes).

Cycles III-VI are those of the calendar by John of Gmunden (Zinner 1925,3624, and identical to the ascribed copy in the ms. Roma Vallicelliana R 63). This calendar was calculated for Vienna, as is also that of Sg (cf. Sg p.13+30-1). Sg has utilized several elements occurring with Peter Philomena's Calendar, notably the letter table with canon (p.13) and the *Qdie*-table originally by William (p.29).

The calendar in Bf,7r-12v, preceding John of Gmunden's has one cycle for 1425-43, thus:

Jan. 1	19	9;43
Jan. 2	-	

Dec. 30 10 9; 2
 Dec. 31 -
 ("I"=1425)

The value for Dec. 30 fits into cycle II above, and a similar fit can be made with the values not shown. This, then, is also a calendar for Vienna; cf. Zinner 1925,3512+ with p.423, who attributes calendars with this range to John of Gmunden on account of similarities of their canons. The T.L. at Bf,13v, was probably meant to serve this calendar.

My sole note from the calendar in the German manuscript Pf,57r+, might fit cycle IV above.

Another German calendar is Mz, 116v-128r (listed in Zinner 1925, 5427, as anonymous, with 3 other mss.). 4 cycles of conjunctions+oppositions for 1463-1538. Excerpt of the conjunction times:

Jan. 1	-	8 19;11	-	-
Jan. 2	8 2;40	-	8 11;43	8 4;15
Dec. 30	-	10 10;21	10 2;53	-
Dec. 31	18 6;30	18 23; 2	18 15;34	7 8; 6

With the displacements expected, the times appear to be 16-17^m less than their counterparts in cycles IV+ above. This calendar has adopted an anonymous T.L.

Two German calendars which do not appear to fit the system above are: Bu,16r-21v (one cycle dated 1401. Jan. 1: 19 18;9. Jan. 2: 8 6;51. Dec. 30: 10 22;1. Zinner 1925,5484) and the calendar preceding the two Viennese ones in Bf (2r-3v), which looks like an attempt to renew Peter Philomena's calendar within its own environment. A further late calendar is in Kh, 155r+ (undated. Jan. 1: 19 0;36. Jan. 2: 8 13;18. Dec. 31: 10 4;26).

(j10) Other tables of conjunctions: Bs,6v+ and 14v ("lunationes secundum aequationem Iudaicam", 1392-1437); Bs,5v,6r,12v,13r ("tabula cycli lunaris magni", 1390-1465); Ba,150r (Jo. de Lineriis); Pr, Iv; Pf,52v; Md,73r. Eclipse lists whose values do not fit (j6) or (j8): N,70vb (1324+), and Mg,163r (1375-80).

The "tabula de incensione lunae", in Ml,148r and Md,73v, with golden numbers during a year, may be an extract from some calendar.

Appendix 6. Astrological additions to the Calendar and T.L.

(a) T&K 996. Manuscripts: *Mk*, 14r-15v, 10r-13v (Zinner 1925, 3924); *Bu*, 2r-9r; *Bv*, 1r-9v (both in Zinner 1925, 7931-3, together with ms. Bern, Burgerbibl., 524B, 1-7, which I have not seen); *So*, 53v-56r. First described by Thorndike, *Osiris* 8(1948)53, from *Bv*.

Contents of the manuscripts: *Mk*: §1-66 (text as printed here). *Bv*: §11 before §9-10, otherwise as *Mk*. *So*: §1-16; 39-47; 57. *Bu*: §1-21; 22-25 (with extensions); 26*-38* (the verses, with notes on elections not in *Bv Mk*, see below); 39-56 (with short additions at ends of §49-55); 58-66; 57 (table with extended explanation, see below); 26-38 (at f.9r-v; text as in *Bv Mk*, without the verses; ending as (d7) below).

Two specimens of the alternative texts in *Bu*:

(§27*) (Hdg.): Luna in ariete. (Txt:) Aries «est signum calidum et siccum, natura colericum, et» respicit caput, et tunc est in brachiis minuendum, balneandum, et quod cito debet finiri et non debet durare est incipiendum. Caput non est medicandum nec sanandum (lan- *ms.*); ad nasum non minuendum; matrimonium non contrahendum; in domum novam vel noviter susceptam non accedere ad immorandum. (Hdg.): Versus. (Txt:) Nil capiti facias. . .radere cures.

(§57) (Hdg.): Quis planetarum regnet in qualibet hora. (Txt:) Tabula sequens ostendit quis planetarum regnet in qualibet hora cuiuslibet diei naturalis. Si vis ergo scire, recipe in hac tabula numerum, cuius horam planetae illius diei velles habere, et directe de numero descende in linea ad dextrum latus, et cum perveneris ad spatium illius diei, de quo quaeris, qui in summo tabulae notatus invenitur, planeta in spatio inventus regnat ipsa die, eadem hora cuius numerum primo recepisti. Verbi gratia, si vis scire quis planeta regnet prima hora die solis, recipe numerum unarium et descende ad dextrum latus usque ad diem solis; tunc reperies quod sol in prima hora dominicae regnat. Si vero secundam horam desideras scire, recipe numerum binarium et descende usque ad diem solis; tunc reperis quod Venus in secunda dominicae hora regnat, et sic de aliis. (Table as printed below in §57).

The extra text in *Bu* has been summarily noted where it occurs; the apparatus only contains a selection of shorter passages which may have been involuntarily omitted in *Bv Mk* (*So*).

Where the texts are comparable, Bu should rank as equal with the consensus of the others, and So as equal with the consensus of Bv Mk. In fact, since the larger variants of Bu mostly look like innovations, I have mainly followed (So) Bv Mk. For convenience I have retained the rubrics of Mk (in italics), supplementing a few from Bv, generally without noting variants. The rest of the variant readings have been registered except where only one of Bv Mk So stands against the other manuscripts present. A few secondary additions and obvious errors in Bu alone have also been excluded.

(1) *Omnis creatura et universa, quae sunt in mundo, efficiuntur¹ motu planetarum, signorum et stellarum, quemadmodum dicit Messahalla in Epistula sua capitulo primo. Et idem vult Ptolomaeus in Centiloquio suo propositione 49a, sic inquit: Et² imagines, quae sunt in hoc compositionis mundo, caelestibus obediunt imaginibus. Et Haly commentator suus ibidem³: Vultus huius saeculi subiecti sunt vultibus supercaelestibus; verbi gratia, scorpio caelestis terrenis scorpionibus dominatur.* (2) Item Haly Abenragel parte prima capitulo primo sic dicit: Duodecim sunt signa in caelo, membris corporum⁴ similia, quorum naturis elementa quatuor gubernantur, quae elementa sunt radices corporum et in eis retenta sunt; et propter existentiam planetarum in signis et introitum planetarum in signa et exitum ex eisdem, et propter aspectum unius planetae ad alterum, fiunt diversitates temporum et aeris mutationes et augmentum caloris et frigoris quolibet anno. Item Guido in Summa sua, parte prima, capitulo secundo, dicit: Non enim credo alicui esse dubium, quin motus caeli circumdans elementa mutet⁵ ignem in aerem, et ipsa mutant alia elementa, aquam scilicet et terram, et cuncta animantia et vegetabilia, et cetera quae sub lunari circulo existunt. (3) Item Albumasar, Alchibicius et fere omnes sapientes in scientia astrorum eruditi in hoc concordant, quod inferiora a superioribus gubernantur; quod etiam sapientissimus philosophorum Aristoteles protestatur in primo libro Metharorum⁶, ubi sic dicit: Mundus iste contiguus est superiori latone⁷, ut⁸ tota virtus eius exinde gubernetur.

(4) Quamvis autem inferiora ab omnibus superioribus continue alterentur⁹, maxime tamen a motu solis et lunae in his inferioribus fit alteratio, quia sunt maxima corpora quantitate et influentia, unde Genesis primo: Fecit autem¹⁰ Deus duo luminaria magna; magna, inquam, in quantitate quantum ad solem.

(5) Nam auctoritate Ptolomaei in Almagesti et Alfragani differentia 22a, sol longe et multo maior est tota terra; et Haly Abenragel parte prima capitulo

Bv Mk So Bu

¹omnes ²etiam Bu ³dicit *add.* Bu ⁴humanorum *add.* Bu ⁵mutat Bv
Mk ⁶Methur- Bu ⁷latior Bu ⁸om. Bu ⁹rantur Bu ¹⁰om. Bu

quarto dicit¹¹: Sol est lumen et candela caeli, gubernator mundi, factor temporum; per eum movetur omnis res movens, et per eum¹² nascitur omnis res nascentis et crescit omnis res crescens, et per eum omne folium maturatur et omnis fructus; ipse est spiritus caeli magnus, per quem omnia vivificantur signa. Item Aristotiles secundo de generatione: Accessus et recessus solis in obliquo circulo est causa generationis et corruptionis in his inferioribus. Et idem secundo Physicorum: Homo generat hominem et sol. *Definitio solis*¹³. Item dicit quidam: Sol est oculus mundi, splendor firmamenti, horarum divisor, temporum distributor, in motibus planetarum particeps et eorum rector, origo vitae, terrae fecundator, fons caloris, totius naturae moderator¹⁴ atque diei dominus. (6) Dicitur etiam deus fecisse duo luminaria magna; et dicitur¹⁵ "magna", scilicet¹⁶ influenza, et hoc quo¹⁷ ad lunam. Nam quamvis luna sit minima stellarum visu notabilium, cum sit longe minor terra, tamen maximam virtutem solet exercere in his inferioribus, quoniam terrae propinquior est. Unde Zahel dicit: Scito quod luna, cuius circulus est omnium planetarum circulo propinquior terrae, prae omnibus planetis similior est rebus mundi; unde vides quod homo incipit esse parvus, deinde crescit donec firmatur, similiter facit et luna. (7) *Definitio lunae*.¹⁸ Unde quidam describens lunam sic inquit: Luna est oculus mundi, splendor noctis, pedisequa solis, fex¹⁹ superiorum, infimus planetarum, aurarum alteratrix, mensium permutatrix²⁰, fons humiditatis atque noctis domina. Habente igitur luna significationem omnium rerum, quia sanitas eius est sanitas omnis rei, et detrimentum eius est detrimentum omnis rei, insuper videmus medullam in ossibus et alios humores in corporibus augmentari et diminui secundum cursum lunae. Unde mare fluit et refluit secundum cursum lunae: cum enim luna movetur ad auge deferentis sui, augetur fluxus maris, cum vero recedit ab auge, minuitur²¹, donec pervenit ad oppositum augis.

(8) Unde, quoniam haec duo corpora prae ceteris planetis magna sunt influenza et virtute, et magister Petrus de Dacia²² in suo kalendario horum²³ motus et coniunctiones posuerit²⁴, idcirco de electionibus quibusdam, quae principaliter fiunt circa lunam, breviter est dicendum. – Cum igitur Magister reverendus in suo kalendario posuerit coniunctiones solis et lunae, sciendum est primo quod coniunctio, incensio et novilunium idem sunt, licet²⁵ nomina diversa. Dicitur, inquam, coniunctio pro tanto quia sol et luna pro tunc coniunguntur et sunt in eadem parte caeli. Vocatur autem incensio, quia tunc luna dicitur incendi a sole secundum vulgum, licet non sit verum, quia semper eius medietas est incensa et splendet, nisi esset eclipsis²⁶ lunae. Vocatur autem novilunium secundum vulgum, quia luna pro tunc acquirit

novum lumen, ²⁷licet non sit verum, ut dictum est, vel acquirit novum lumen^{28.27} quoad nos, quia nobis iterum incipit apparere.

(9) *Sequitur de electionibus.* Post haec de electionibus quibusdam, et primo de his, quae fiunt circa locum lunae, est videndum. (10) *Quando sit bonum sanguinem extrahere*²⁹. In minuendo sanguinem et ventosando³⁰ dicit Haly Abenragel: Sit luna in signis aereis vel igneis et sit fortunata. – Ut autem scias qualitates signorum et in quibus sit bonum minuere sive sanguinem extrahere³¹, nota hos versus.

Versus de qualitate signorum:

³²Igneae sunt A Leoque Sa, terrea Tau Cap et Virgo³³,
Ae Ge Libra³⁴ et Aqua, Scor Can Pis sunt quoque unda^{35.32}.
Est Aries minuendi³⁶ bonus, sic Libra Sagitta,
Sic et Aquarius est.

*Item*³⁷ *versus de qualitate signorum:*

Libra cum Geminis Aquario sanguinea sunt,
Sunt³⁸ quoque colerica Aries Leoque Sagitta,
Scorpio flegmatica Pisces sunt Canceres signa.
³⁹Sunt Capri cornus Virgo terrestria Taurus³⁹.

Et quando volueris extrahere sanguinem cum ventosa, bonum est ut sit post oppositionem solis et lunae. Sed⁴⁰ si extrahis sanguinem de vena, melius est ut sit in prima medietate mensis, id est lunationis. (11) Et caveas ne tangas membrum⁴¹ ferro, luna existente in signo membrum illud signante, quia dicit Ptolomaeus in Centiloquio propositione 20a: Operari cum ferro in aliquo membro, luna existente in signo membrum illud respiciente, horribile est. Et Haly commentator eius reddit rationem ibidem: Quia luna magnum humorem mittit⁴² in membrum istud, cum in signo illius membri fuerit luna. Ut autem scias, quod signum cuilibet membro corporis influat⁴³, respice imaginem unam⁴⁴, in qua nomina signorum membris, quibus influunt, sunt inscripta:

(12) Item in⁴⁶ flebotomia ne⁴⁷ sit luna in geminis aut in piscibus aut in via combustionis, hoc est in fine librae et in principio scorpionis, in quolibet ad 12 gradus. *Quando sit bonum medicinam laxativam sumere.* In medicinis laxativis non sit luna in signis ruminantibus, sicut est aries taurus leo capricornus, nisi sit medicina vomica; sed sit luna in signo scorpionis aut in signo humido et frigido, vel ad minus humido. (13) *Quando sit bonum intrare balneum.* In introitu

balnei sit luna in ariete vel in⁴⁸ scorpione vel in piscibus⁴⁹ sagittario cancro libra vel in tauro. Et dicit Haly Abenragel quod melior electio in hoc est ut sit luna in signis aqueis, ut est scorpio cancer piscis. Et non intres balneum, luna existente in signis calidis et siccis, nisi feceris hoc in sanando de humoribus malis vel de paralyti. **(14)** *Quando sit bonum capillos tondere.* In tondendo capillos dicit Haly Abenragel quod melior electio est in hoc ut sit luna in libra sagittario vel aquario aut in piscibus. Et caveas ne applices ferrum capiti tuo, luna existente in ascendente, scilicet⁵¹ in oriente. **(15)** *Quando sit bonum unguis praescindere.* In⁵² incidendis unguibus dicit Haly Abenragel: ⁵³Electio melior est in hoc⁵³ ut sit luna aucta lumine, et quod non sit in geminis vel in piscibus vel quod aliquod istorum duorum signorum sit ascendens; sed sit luna in libra tauro vel ariete, scorpione cancro vel leone. **(16)** *Quando sit bonum novam vestem sarcire vel induere*^{53a}. In incidendis et induendis novis vestimentis seu vestibus dicit Haly Abenragel quod melior est in hoc electio, quod luna sit in signis mobilibus, quae sunt aries cancer libra capricornus; et si etiam fuerit in signis communibus, non est malum, quae sunt gemini virgo sagittarius pisces. Caveas tamen⁵⁴ in coniunctione et oppositione; et caveas tibi ne sit luna in signis fixis, quae sunt taurus leo scorpius aquarius, in principio incisionis⁵⁵, nisi sit vestis armigera, quia in hoc fixa signa⁵⁶ mala non sunt. Et pone lunam in medio caeli, et sit luna crescens lumine; et sit luna, quando indueris vestem novam, in signo mobili; et inter omnia signa fixa deterior est leo, unde Ptolomaeus in Centiloquio, propositione 22a: Indumenta induere nova, luna existente in leone, horribile est⁵⁷, praesertim si maligna fuerit. **(17)** *Quando sit bonum venare.* In venando per terram et aquam dicit Haly Abenragel: Electio melior est in hoc ut luna sit in tauro, in virgine, in capricorno; et dixerunt sapientes quod qui voluerit venare per terram, bonum est ut ponat lunam in ariete leone vel sagittario, applicando⁵⁸ Marti bono aspectu cum receptione. Et dicit quod expertus sit vitae⁵⁹ nec umquam viderit venatorem, qui exiret venatum tauro ascendente aut geminis aut scorpione, qui rem aliquam caperet, licet etiam bonos haberet canes et eventus bonos in his haberet et similia, et licet bonus esset venator. Et quos vidit exire ad venandum ascendente capricorno, vidit quod venatio abscondebatur eis. Et hoc intellegitur⁶⁰ maxime in venando quadrupedes; sed si volueris capere aves, sit luna in geminis libra vel aquario, applicando Mercurio. **(18)** *Quando sit bonum cum mulieribus iacere.* In iacendo cum mulieribus dicit Haly⁶¹ Abenragel: Sit luna in signis quae habent dilectionem in opere illo, quae sunt aries capricornus leo et libra; et cum hoc si luna applicaverit se Veneri vel Marti, erit melius, quia Venus signat⁶² gaudium et dilectionem quae animalia habent⁶³ adinvicem,

Mars vero multum semen signat⁶⁴. Caveas etiam in hoc opere ne luna sit in piscibus; sed si luna sit in geminis libra vel aquario, bonum est, et si feceris causa habendi filium, sit signum ascendens in oriente. **(19)** *Quando sit bonum iter incipere.* In iter arripiendo sit luna in signis mobilibus praeterquam in fine librae; et in eundo per aquam sit luna in ariete⁶⁵ cancro aquario et piscibus.

(20) *Sequitur quid sit signum et quot sint.*

Et quia multa de signis dicta sunt, ne per ambiguum procedatur, videndum est quid sit signum et quot sint⁶⁶ signa. *Definitio signi.* Ubi⁶⁷ nota quod signum est certum⁶⁸ spatium, puta duodecima pars zodiaci, ab astronomis inventum et a caeli compositione probatum. Vel⁶⁹ sic: Signum est certum spatium caeli, a stellarum dispositione et ordine a calculatorum sagacitate cum quibusdam limitibus determinatum. **(21)** *Quid sit zodiacus et unde dicatur.* Et quia dictum est de zodiaco, scias quod zodiacus est quidam latus circulus, habens in latitudine 12 gradus, et sub eo moventur omnes planetae; et dicitur zodiacus a 'zoe', quod est vita, quoniam secundum motum planetarum sub illo est omnis vita in rebus inferioribus. Vel dicitur a 'zodias', quod est animal, quia cum dividitur in 12 partes aequales, quaelibet pars appellatur signum et nomen habet speciale a nomine alicuius animalis propter proprietatem aliquam convenientem tam ipsi signo quam animali, vel propter dispositionem stellarum fixarum in illis partibus ad modum huiusmodi animalium. Et iste circulus Latine dicitur signifer, quia fert signa, vel quia dividitur in 12 signa; quorum nomina continentur his versibus.

Ordo numerus et nomina signorum continentur his versibus:

Sunt Aries Taurus Gemini Cancer Leo Virgo

Libraque Scorpius Arcitenens Caper Amphora Piscis.

Quodlibet autem istorum signorum habet signum sibi directe oppositum. Quod signum alterum⁷⁰ alteri opponatur, patet per hunc versum.

Oppositio signorum patet hoc versu:

⁷¹Est Ari Li, Scor Tau, Sa Gemin, Can Cap, Leo A, Pis Vir⁷¹.

Nam aries opponitur librae, taurus scorpioni, gemini sagittario, cancer capricorno, leo aquario, virgo piscibus.

(22) *Item divisio signorum.* Istorum autem 12 signorum quaedam dicuntur mobilia tropica seu conversiva, quaedam dicuntur fixa stabilia seu⁷² firma, et quaedam⁷³ communia. Et ut scias quae vocentur mobilia, quae fixa, et quae communia, nota hos versus⁷⁴:

Mobilis est Aries Cancer Capricor quoque Libra,

Sed Leo sunt stabiles et Taurus Scorpio Lympha,

Virgo Sagit Pisces bipertita sunt geminique.

add. Bv Mk ⁶⁶sunt Bu ⁶⁷verbi gratia Bu ⁶⁸tertium Bv Mk ⁶⁹aliter

 Bu ⁷⁴h. v.: v. h. Bv Mk ⁷⁵om. Bv Mk ⁷⁶quod Bv Mk ⁷⁷in add. Bu

(23) *Quare quaedam signa⁷⁵ vocentur mobilia, et quid⁷⁶ bonum sit agere vel vitare, luna in eis existente.* Dicuntur autem aries cancer libra capricornus signa mobilia pro tanto quia, cum sol ingreditur ista signa sive initia istorum signorum, mutatur tempus ad substantiam sequentis temporis, quia cum sol intrat⁷⁷ arietem, mutatur ut frequenter tempus hiemale in tempus vernale, et sic de aliis. Unde⁷⁸, luna existente in istis signis mobilibus, omnia citius alterantur negotia: odium, inimicitia et adversitas instabilia sunt et infirma; aedificiorum fundamenta locare, vel castra vel civitates construere, penitus fieri non debet, quoniam instabilitas contra hoc ruinam minatur. In aegro diuturnitatem morbi negant. Vendere et⁷⁹ emere penitus est inutile, quia non diu manent vendita⁸⁰ apud emptorem. Siquid⁸¹ promittitur vel datur, non multum durat. Data et accepta beneficia minime prosunt. Quidquid boni vel adversi occurrit, non⁸² diurnum⁸³ neque stabile est. Medicus non curet aegrum, quia non convalescet⁸⁴ ad plenum, quia denuo recidivabit. (28 verba add. Bu) Scito etiam quod signa mobilia rerum mutabilitatem signant⁸⁵, et quod⁸⁶ nihil debet fieri in eis, quod durable existere debet, vel incipi in eis, quod debet multo tempore durare aut stabile permanere. Sed festina et indurabilia et quorum finis cito desideratur, incipi debent in eis⁸⁷. Si de carcere quis⁸⁸ effugerit sive exierit, cito recapietur. (19 verba add. Bu) Est autem⁸⁹ bonum conubia et amicitias tunc⁹⁰ tractare⁹¹, sed non⁹² firmare nisi in signis fixis. (79 verba add. Bu) (24) *Quare quaedam signa dicuntur fixa, et quid bonum agere sit vel quid vitare, luna in eis existente.* Dicuntur autem taurus leo scorpio et aquarius signa fixa stabilia sive firma, ideo quia⁹³, cum sol intrat in ista signa⁹⁴, tempus figitur in esse suo et non mutatur, quia cum sol⁹⁵ intrat taurum, figitur tempus vernale, quod incipit sole intrante in arietem. Item tempus si fuerit⁹⁶ calidum, sole intrante in aliquod istorum signorum, figitur tempus in calore, et sic de aliis. Et istud manifeste⁹⁷ videtur in qualibet parte anni. Unde⁹⁸ luna in eis⁹⁹ existente bonum¹⁰⁰ est omnia tractare et incipere¹⁰⁰, quae debent diu durare, unde bonum est¹⁰¹ domum et alia aedificia incipere et aedificare, nuptias celebrare, quarum fuit¹⁰² in signis mobilibus praemissa tractatio. (8 verba add. Bu) Promissum datur et ultra non revertitur. Irae¹⁰³, rixae et contentiones¹⁰⁴ exortae vix vel non pacificantur, nisi multa apponantur remedia¹⁰⁵. Qui vinctus vel captus fuerit, prolongabitur eius labor. Condiciones¹⁰⁶ ¹⁰⁷et donationes accipere bonum est¹⁰⁷, (14 verba add. Bu) et omnia¹⁰⁸ quae ad utilitatem pertinent, ¹⁰⁹bona sunt: emere, vendere, novam domum intrare, [s]omnia bona¹⁰⁹. (7 vbb. add. Bu) De carcere bonum est exire vel de captura¹¹⁰,

quidquid vis fixum et firmum permanere, fac et incipe, luna existente in his signis fixis. (15 verba add. Bu) **(25)** *Quare quaedam signa¹¹¹ vocantur communia, et quid sit bonum agere et¹¹² quid vitare, luna in eis existente.* Dicuntur autem signa communia gemini virgo sagittarius¹¹³ piscis, propterea quia, cum sol moratur in his signis, tempus fit¹¹⁴ commune, id est¹¹⁵, medietas istius erit unius temporis et medietas erit alterius temporis. Verbi gratia, quando sol intrat geminos, quod est primum signum commune, fit tempus commune, id est, medium erit veris et medium aestatis; et sic¹¹⁶ de aliis signis communibus. Et propterea dicuntur etiam bipertita sive¹¹⁷ bicornia. Luna¹¹⁸ in his signis existens¹¹⁹ si qua emanatur, non permanent diu apud emptorem. Siquis in his nascitur, fraudulentum et adulatorem aestima. (73 verba add. Bu). Non est bonum¹²⁰ fieri conubia; ¹²¹quod promittitur et data et accepta beneficia¹²¹ minime prosunt. Et^{121a} caveas ne incipias, luna existente in his signis, aliquid quod vis diu permanere, sed incipe quidquid petis iterari vel duplari.

(26)¹²² *De nominibus signorum 12, et quare sic vocentur, et quam partem corporis humani quodlibet respiciat, et quid bonum agere, quid vitare, luna in quolibet existente.* Duodecim sunt signa, scilicet aries taurus gemini cancer leo virgo libra scorpium sagittarius capricornus aquarius piscis. **(27)** Et quia aries in prima constitutione mundi coepit vergi ab oriente sursum¹²³, primum in ordine signorum dicitur. Primum autem signum idcirco aries dicitur¹²⁴, quia, quemadmodum aries est animal in parte posteriori debile, in parte vero anteriori forte, ita sol, cum est in illa parte caeli quae aries appellatur versum¹²⁵ illam partem quae hiemem respicit, debilis est et modicum habet calor; in illa vero parte, quae respicit aestatem¹²⁶, fortior est sol in calore et fervore¹²⁷. Est aries signum calidum et siccum, et respicit¹²⁸ in corpore hominis caput, faciem, pupillas, oculos, supercilia et frontem. *Luna in ariete:*

Nil capiti facias, aries cum luna refulget,

Brachia tunc minuas, et balnea tutius intres,

Non tangas aures, nec barbam radere cures.

(28) *Luna in tauro.* Taurus, secundum signum, sic appellatum ex eo quia tunc labores taurorum sive boum apparent, vel quia, sicut taurus est animal fortius ariete, ita sol in illa parte zodiaci existens, quae taurus appellatur, fortior est in calore. Et est signum frigidum et siccum, et habet respicere in corpore hominis collum et guttur.

Arbor plantetur, cum lunam¹²⁹ taurus habeat,

Aedificare potes, non spargas semina terrae,

Et medicus timeat cum ferro tangere collum.

(29) *Luna in geminis*. Gemini, tertium signum, sic appellatum quia, sole in eo existente, geminatur virtus eius in calore; vel quia, sicut gemini depinguntur iuvenes amplectentes se, ita, quando sol est in illa parte caeli, quaedam terrae nascentia amplectuntur se per radices et pubescunt superius in herbam et germinant¹³⁰ suos fructus. Et est signum calidum et humidum, et respicit in homine humeros, spatulas et brachia usque ad manus.

Brachia non minuas, cum lustrat luna gemellos,

Unguibus et manibus cum ferro cura negetur,

Numquam portabis a promissore¹³¹ petitum.

(30) *Luna in cancro*. Cancer, quartum signum, sic vocatum quia, sicut cancer est animal retrocedens, ita sol existens in illa parte¹³² zodiaci a nobis incipit recedere: nam in ipsius principio est solstitium aestivale. Et est signum frigidum et humidum, et respicit in homine pectus, manus, pulmonem, costas et splenem.

Pectus pulmo iecur in cancro non minuatur,

Somnia falsa vides, est utilis¹³³ emptio rerum,

Potio sumatur, securus perge viator.

(31) *Luna in leone*. Leo, quintum signum, sic nuncupatum quia, sicut leo est animal calidissimae¹³⁴ naturae et implacabilis irae, ita sol existens in illa parte zodiaci est calidissimus in effectu, et sole in leone existente sunt dies caniculares. Et est signum calidum et siccum, et respicit in homine stomachum, cor, nervos¹³⁵, ossa lateris¹³⁶, dorsum.

Cor gravat et stomachum, cum cernit luna leonem,

Non facias vestes nec ad convivia vadas,

Et nil ore vomas, non sumas tunc medicinam.

(32) *Luna in virgine*. Virgo, sextum signum, sic dictum quia, sicut virgo sterilis est¹³⁷ et nihil parit, ita tempus, sole existente in illo signo, nihil producit sed producta maturat. Et est¹³⁸ signum frigidum et siccum, et respicit in homine ventrem et omnia loca occulta, hepar¹³⁹, intestina.

Lunam virgo tenens uxorem ducere noli,

Ungento costas caveas curare chirurge,

Detur agro semen, dubites intrare carinam.

(33) *Luna in libra*. Libra, septimum signum, sic vocatum, quia sole in eo existente librantur et aequantur dies et noctes, et in eo est aequinoctium autumnale. Est autem signum calidum et humidum, et respicit in homine inferiorem partem ventris, umbilicum, renes, anchas et vesicam, verenda, dorsum et ilia.

Libra nitens luna nemo genitalia tangat

Aut renes, nates¹⁴⁰, nec iter carpere temptes,

Extremam partem librae cum luna tenebit.

(34) *Luna in scorpione*. Scorpio, octavum signum, sic vocatum, quia scorpius dicitur quasi carpius, quia in fine carpit frigore. Sicut enim scorpio cum cauda

¹³²caeli sive *add.* Bu ¹³³inutilis Bv Mk ¹³⁴-mum Bu ¹³⁵nerves Bv Mk

¹³⁶o.l.: latera Bu ¹³⁷om. Bv Mk ¹³⁸et est: est Bv Mk; et (!) autem virgo Bu

pungit, ita matutina et vespertina illo tempore male vestitos frigore mordent. Est autem signum frigidum et humidum, et respicit in homine loca pudibunda¹⁴¹ et vasa seminaria, viscera, testiculos, anum et vesicam, vulvam fet caliginem oculorum[†], medullam, et earum infirmitates.

Scorpius augmentat morbos in parte pudenda,
Vulvam ne cures, caveas ascendere naves,
Nec iter arripias, caveas de morte ruinam.

(35) *Luna in sagittario*. Sagittarius, nonum signum, sic dictum, quia sole in ea parte zodiaci existente in nos emittuntur sagittae temporis illius, puta frigora, gelua¹⁴² excellentiora quam sole existente in signis antecedentibus. Est autem sagittarius signum calidum et siccum, et respicit in homine superiora in membris, calvitiem, spinam dorsi, abscissiones membrorum, coxas et femora.

Luna nocet femori per partes mota sagittae,
Ungues et crines poteris praescindere tute,
Tunc barbas¹⁴³ radas et merces emere vadas.

(36) *Luna in capricorno*. Capricornus, decimum signum, sic appellatum quia, sicut caper¹⁴⁴ in pascendo ascendit sive caput seu cornua erigit, ita sol tunc ab inferiori hemisphaerio ad nostrum se erigit hemisphaerium superius, et in eo est¹⁴⁵ solstitium hiemale. Est autem signum frigidum et siccum, et habet respicere in¹⁴⁶ corpore hominis genua et eorum nervos.

Capra nocet genibus ipsam cum luna tenebit,
Intres aquas nauta, citius curabitur¹⁴⁷ aeger,
Fundamenta ruunt, nihil est quod duret in ipso.

(37) *Luna in aquario*. Aquarius, undecimum signum, sic nominatum, quia sole in eo existente ut frequenter tempus est aquosum et humidum. Est signum calidum et humidum, et habet in corpore hominis tibias¹⁴⁸, crura a tibiis usque ad talos, et nervos ibidem.

Tangere crura cave cum luna tenebit aquosum,
Inserere tunc plantas, excelsas erige turres,
Et si carpis¹⁴⁹ iter, ad locum tardius ibis.

(38) *Luna in piscibus*. Piscis, duodecimum signum, sic nuncupatum quia, sicut pisces in fluvio natant, ita, sole existente in illa parte zodiaci, omnia in pluviis natate videntur. Sed si contrarium his omnibus quandoque contingit, hoc operatur¹⁵⁰ diversus aspectus et motus planetarum. Est autem piscis¹⁵¹ signum frigidum et humidum, et habet in¹⁵² corpore hominis pedes, nervos¹⁵³, dolores nervorum, et podagram. (31 verba add. Bu)

Piscis habet lunam, noli curare podagram,
Carpe viam tutus, fit potio sumpta salubris,
Embryo conceptus epyleuticus exit ab alvo.

(39) *Sequitur de sphaeris et earum ordine*¹⁵⁴. Nunc de sphaeris et de¹⁵⁵ planetis, quae per signa duodecim discurrunt et moventur, aliqua sunt dicenda, et primo de sphaeris et ordine ipsarum. (40) Ubi nota quod quatuordecim sunt sphaerae¹⁵⁶: prima et maxima empyrea dicitur, et dicitur ab 'en', quod est 'in', et 'pir', quod est ignis, quasi totum in igne divini amoris, et ibi dicitur esse habitatio beatorum; et de ista sphaera philosophi et astronomi nihil senserunt, sed theologi ipsam ponunt¹⁵⁷. Et ultra istam sphaeram non est locus neque tempus. Et est¹⁵⁸ sole clarior¹⁵⁹, eius distantia est <in>investigabilis, et sicut est maxima ambitu, sic est¹⁶⁰ maxima in virtute; unde disponit ad infusionem animae rationalis. Cuncta etiam vegetat et conservat: natura enim lucis disponit ad vitam; et est immobilis. (41) *De sphaera primi mobilis*. Post hanc sphaeram sequitur sphaera primi¹⁶¹ mobilis, quae secundum theologos dicitur caelum¹⁶² aqueum sive crystallinum, cuius distantia est nobis <in>investigabilis, quia non habet stellas. Cuius¹⁶³ motus est ab oriente in occidens, quo motu rapit secum omnes sphaeras inferiores. Et istud caelum maxime disponit ad animae sensibilis formationem. Et dicitur aqueum, quia aquae, quae ibi sunt, habent similitudinem cum aqua, quae apud nos est, in perspicuitate et in effectu, quia¹⁶⁴ frigiditas sua temperat calorem firmamenti; sed tamen¹⁶⁵ non sunt graves neque leves. (42) *De sphaera stellarum fixarum*. Deinde sequitur caelum sidereum seu firmamentum, quod caelum stellatum appellatur, eo quod in ipso omnes stellae fixae contineantur; ad quam sphaeram, propinquior ubi¹⁶⁶ est terrae, veniret¹⁶⁷ homo in 7986 annis et 46 septimanis¹⁶⁸, si eius diaeta esset decem miliarium. Eius proprius motus est secundum Ptolomaeum in 100 annis¹⁶⁹ uno gradu: sed motu primi mobilis movetur omni die naturali semel circa terram. (43) *De sphaeris VII planetarum*. Post hanc sphaeram sequuntur sphaerae septem planetarum. Et prima post firmamentum est sphaera Saturni, ordo autem istorum¹⁷⁰ septem planetarum et nomina hoc versu continentur.

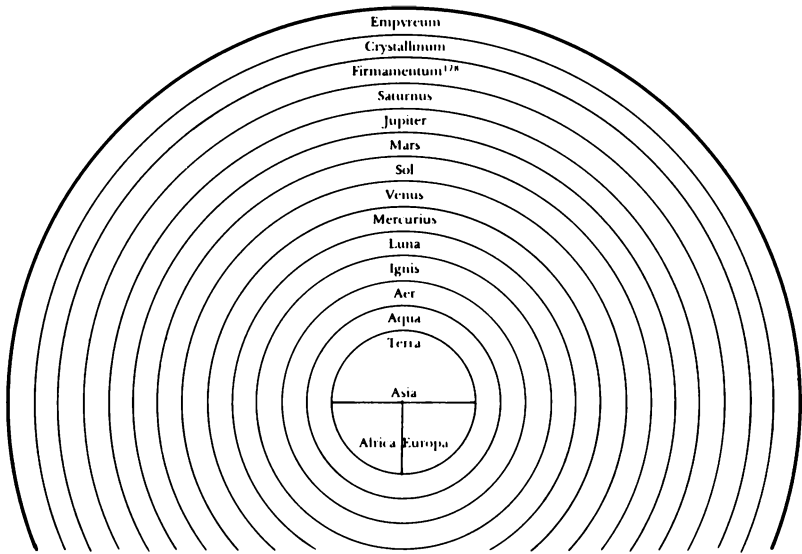

Versus continens nomina planetarum et ordinem:

Cynthia Mercurius Venus et sol Mars Jove¹⁷¹ Satur,
ita quod Saturnus est supremus, deinde Jupiter, deinde Mars, deinde sol, deinde Venus, deinde Mercurius, deinde luna, quae est planetarum infima et terrae propinquior. (44) *De sphaera ignis*. Post has septem sphaeras planetarum sequitur sphaera ignis, qui ignis est calidus et siccus, inter alia elementa maxime activus¹⁷²; non est eiusdem rationis cum igne apud nos existente, quia iste ignis apud nos est corruptivus, ille est generativus et conservativus. Et nisi ille ignis coniunctus sit¹⁷³ alicui grassae materiae, non potest esse extra suam

Bv Mk So Bu

sphaeram. Non videtur sphaera sua propter subtilem suam substantiam¹⁷⁴. (45) *De sphaera aeris et eius interstitiis*. Ex hinc sequitur sphaera aeris, et est aer calidus et humidus et maxime passivus. Et habet tria interstitia: supremum, ubi est aer calidus et subtilis propter vicinitatem ignis; medium, ubi est aer frigidus et caliginosus, et ibi dicitur esse habitatio daemonum, et ibi generantur impressiones, grandines, nives et tonitrua; infimum interstitium est apud nos, ubi est aer temperatus propter reflexionem radiorum solarium a terra reverberantium. (46) *De sphaera aquae*. Sphaeram aeris sequitur sphaera aquae, et est aqua frigida et humida et circumdat terram sicut cetera elementa, praeter partem unam terrae, quae dispositione divina sicca permansit propter vitam animalium inspirantium et respirantium conservandam. (47) *De sphaera terrae et tribus eius partibus*. Deinde sequitur sphaera terrae, quae omnium est infima et in medio totius universi orbis immobiliter locata; et est terra frigida et sicca, et in eius medio infernus esse dicitur. Pars autem terrae habitabilis dividitur in partes tres¹⁷⁵, scilicet Asiam, Africam et Europam, quae ulterius in diversas provincias, regiones et regna dividuntur, ut in mappa mundi plenius videre poteris. Nos autem Alemanni sive Germani in Europa parte constituti sumus¹⁷⁶. ¹⁷⁷Et has 14 sphaeras et tres partes terrae habitabilis in figura videre poteris satis clare¹⁷⁷.

Bu ¹⁷⁵p.t.: t.p. Bu ¹⁷⁶sumas Bv Mk ¹⁷⁷⁻¹⁷⁷et harum omnium sphaerarum figuram habes verso folio Bu ¹⁷⁸sub circulo firmamenti habet Bu circulum qui nomina signorum continet

(48) *Sequitur de planetis magis specialiter.* Nunc de planetis magis in speciali est videndum. Et ut¹⁷⁹ scias qualitates planetarum, nota hos versus.

Versus de qualitate planetarum:

Frigidus et siccus Satur, Jupiter aestuat udus,
Mars et¹⁸⁰ sol sicci fervent, sed luna Venusque
Udae frigescent, medius Cilleneus¹⁸¹ esto.

Et nota quod calor Martis est mortalis, caliditas vero solis vitalis. Ut autem scias, quis planeta sit benevolus et quis malevolus et quis mediocris, nota hos versus.

Versus qui planetae boni, qui malevoli:

Jupiter atque Venus boni sunt, Sat Marsque maligni,
Sol et Mercurius cum luna sunt mediocres.

Et ut scias quanto tempore quilibet¹⁸² planeta percurrat zodiacum, nota hos versus.

Versus quanto tempore quilibet¹⁸³ planeta percurrat zodiacum:

Annis triginta per signa meatque Saturnus,
Atque duodenis percurrit Jupiter annis,
Zodiacum totum Mars binis pervolat annis,
Trecentis sexagenis ac quinque diebus
Ac horis sex zodiacum sol pervolat omnem,
Trecentis bis viginti Venus octo diebus
Currit, trecentis bis denis Mercurialis,
Octo bis decem concurrit luna diebus.

(49) *Sequitur specialiter de Saturno.* Saturnus inter planetas nobis est remotissimus¹⁸⁴, frigidus et siccus effective, et ideo, cum hae¹⁸⁵ qualitates sint generationi contrariae, perdit omnia terrae nascentia in illa terra, in qua dominatur. Et ideo dicitur Saturnus quasi 'satur annus' per contrarium¹⁸⁶. Percurrit zodiacum in 30 annis. Saturnus etiam est malevolus, et ideo in rebus malos causat effectus; praestit homini a 58 annis usque ad finem vitae; et primo mense conceptionis conceptum in frigiditate, et in matrice coagulat et siccatur. Disponit hominem sub eo genitum fuscum, paucos pilos in barba et in maxillis habentem, qui cum ambulat, in terram oculos mergit; et est¹⁸⁷ macer, parvos habens oculos, pilos asperos et incultos¹⁸⁸ habet, piger, raro ridet, iracundus venenosus et turpis, ingeniosus circa artes viles, turpia amat vestimenta, callidus est, aliud sonans ore¹⁸⁹, aliud corde machinans. (3 *versus et alia pauca add.* Bu) (50) *De Jove.* Jupiter secundum suum effectum est calidus et humidus, et idcirco naturae amicus, cum hae qualitates sint principium generationis et vitae. Et ideo¹⁹⁰ dicitur Jupiter quasi 'iuvans pater'. Benevolus est; in 12 annis zodiacum percurrit; praestit homini a 46 annis usque ad 58; ex bonitate sua temperat et reprimit malitiam Saturni et Martis.

Est colore argenteus; mense secundo conceptionis fetui dat¹⁹¹ membra et spiritum. Facit hominem bonum et honestum, cui barbam dat rotundam, pulchros oculos, dentes duos superiores dat maiores, et aliquando¹⁹² aliquantulum divisos facit; huius hominis in facie est color albus mixtus rubeo, utitur libenter vestibus pulchris; capilli longi et pulchri more religiosorum; in eundo terram respicit; est misericors, diligens bonum, detestans malum. Disponit etiam ad artes subtiles, ut est legere, scribere, pulchras res tractare, ut pulchros pannos¹⁹³, aurum et argentum. (2 versus ins. Bu) (51) *De Marte*. Mars in effectum¹⁹⁴ calidus et siccus, quodammodo vitae contrarius, malevolus; et dicitur Mars quasi 'mors': per eius enim impressionem multae fiunt causae mortis. Dicitur etiam deus belli et discordiarum dominus; percurrit zodiacum in duobus annis; praeest homini a 31. anno usque ad¹⁹⁵ 46.; tertio mense conceptionis ossa conceptui¹⁹⁶ et membra interiora componit. Mars dat hominem curvum habere corpus ipsumque grossum; facit hominem scismaticum; huius in facie color rubeus mixtus nigro, id est brunum habet colorem, sicut qui ad solis radios¹⁹⁷ vadunt, et in facie saepe habet grana rubea; raros in barba pilos gerens, quasi spado deputatus est¹⁹⁸. Sciunt et noverunt inter homines discordias seminare, dehonestant bella, inter¹⁹⁹ quietos lites seminant; qui sub eo nascuntur sunt igniferi, ut fabri, coci, macellarii²⁰⁰, sanguinis effusores, crudeles et immisericordes et vindictam accipientes. Et ipse Mars est rutilans sicut ignis et disponit ad masculinum sexum. (17 verba et 2 versus add. Bu) (52) *De sole*. Sol calidus²⁰¹ et siccus in effectum; qualitates eius sunt vitales, et causa generationis mediocris est, id est, cum bonis bonus, cum malis malus; et dicitur sol quasi 'solus super omnia lucens'; omnes enim stellae lumen recipiunt a sole. Et est maxima stellarum et planetarum, quia est centies sexagesies maior terra; percurrit zodiacum totum in uno anno; praeest homini a 22. anno usque ad 31. annum; in quarto mense conceptionis dat conceptui²⁰² sanguinis caliditatem et perficit totum corpus. Disponit ad masculinum sexum, facit hominem plenum, pulchrae faciei et albae mixto²⁰³ colore citrino, quandoque magnorum oculorum; iuxta magnos viros libenter moratur, humilis aliquando, licet ex natura nobilis; optat²⁰⁴ dominia, et aliquando ex solaribus fiunt principes, et sunt agiles²⁰⁵. Sol etiam praeest auro et disponit ad opera auri, et est aurei coloris; sol cursu suo tempora distinguit, vapores elevat; appropinquans nobis aestatem facit, recedens²⁰⁶ hiemem efficit, communis est omnibus mediis planetarum. (15 verba et 2 versus add. Bu) (53) *De Venere*. Venus est planeta in effectum frigidus et humidus, benevolus, et idcirco²⁰⁷ bonos habet effectus; percurrit zodiacum in tanto tempore sicut sol fere. Praeest homini a 14. anno usque ad 22. annum; mense quinto conceptionis dat conceptui plene²⁰⁸ aures, supercilia, nasum, et faciei membra,

testiculos iuvat, disponit ad sexum femineum. Facit hominem pulchrum, pulchros habentem capillos et pulchra supercilia; dulcia ac mollia fundens verba, mediocris est staturae; totus Venereus, movet se in eundo aut aliquid faciendo leviter cum lascivia; cantator, saltator, amat instrumenta musicalia, delectatur in vestimentis pulchris. Venus quandoque est lucifer, quandoque vesperus, quia semper comitatur²⁰⁹ solem, et maxima elongatio Veneris a sole est 45 graduum; et quando²¹⁰ praecedit solem, est lucifer, quando sequitur, est vesperus. (2 versus ins.Bu) (54) *De Mercurio*. Mercurius nullius qualitatis est determinate, quia nec calidus nec frigidus nec humidus nec siccus esse dicitur, sed indifferens est, sicut speculum indifferens est ad quamlibet formam recipiendam, quae sibi obicitur; unde cuicumque planetae coniungitur²¹¹, eius qualitatem et complexionem inferioribus fortius nuntiat. Et ideo²¹² bene dicitur interpretes deorum, id est planetarum, qui dii dicebantur. Dicitur etiam Mercurius quasi 'mercatorum kyrios', id est dominus. Est mediocris sicut sol, id est cum bonis planetis bonus, cum malis malus; est minor inter planetas; complet cursum suum in²¹³ zodiaco trecentis XXXa diebus. Et praest homini a 4. anno usque ad 14. annum; sexto mense conceptionis conceptui²¹⁴ foramina, nares, linguam ordinat. Raro videtur, quia semper prope solem graditur: maior enim distantia, qua a sole recedit, est 23 graduum. Coloris est fuscus, quia radiis solaribus obumbratur. Disponit ad utrumque²¹⁵ sexum; disponit ad arismetiam et computationem; facit hominem gracile corpus habens²¹⁶, est autem mercurialis homo sapiens, lectioni libenter vacans, staturae saepius mediocris, sufficienter acquirens amicos, sed non leviter retinens; pulchram barbam, subtilia quandoque gerit labra²¹⁷ et nasum similiter; quod inceperit cito complebit; coloris medii mixti et variabilis, quia nunc albus, nunc niger; frontem elevatam habens; iuxta potentes et nobiles libenter moratur. (2 versus ins.Bu) (55) *De luna*. Luna²¹⁸ humida et frigida: habet enim potentiam super humidum; mediocris est ut sol et Mercurius; percurrit zodiacum in 28 diebus et modico plus. Dicitur autem luna quasi 'luce nitens aliena'²¹⁹. Praest homini a nativitate usque ad 4. annum; septimo mense conceptionis plasmat pulmonem et dividit membra per loca sua; et si puer tunc nascitur, est vitalis, quia omnes planetae sunt in eo operatae²²⁰ suum effectum. Sed si in octavo mense puer nascitur, non vivit, quia retrocessio fit ad Saturnum, qui frigiditate sua restringit membra concepti²²¹. Nono mense natus vivit, quia regnat in eo Jupiter, qui nulli nocet sed omnibus prodest. Disponit ad sexum femineum. Luna autem dat hominem nullius esse servitii, qui die ac nocte ire desiderat, huc atque illuc discurrens, nec leviter stabilis manet alicubi. Faciem habet rotundam, staturam medio-crem; est autem illi unus oculus maior altero, vel est strabo vel omnino orbus altero oculorum; nullatenus vitio oculorum carebit. Nuntius est nugarum, venditor olei, mellis, ficuum et huiusmodi. (11 verba et 2 versus add.Bu)

Et haec de proprietate planetarum dicta sufficiant.

(b) Texts ascribed to Peter of Dacia in Lo,9v-12r. Apparently first noted by Eneström (1885,3)23; discussed by Olaf Pedersen 1976,31-3; and edited by myself (1980,621-7). The paragraphing of that edition has been retained for convenience; of the paragraphs here omitted, §11-2 equal App.3(a1), and §13 is a version of the T.L.

Anonymous versions, cf.T&K 891: Od,7r-9v (=Od₁) containing §14, App.3(c1) with a miswritten lunar table, §15-27 and part of §28, and §2-9; and Od,53r (=Od₂) containing §14, §28, and App.3(a2) with a 13×13 lunar table.

The ascription in Lo cannot be corroborated nor yet explained. The textual witnesses are English, and the varying versions of the T.L. with canons belong to those mostly found in the later English tradition (*Pref.* §22). The text itself is mainly a paraphrase of (d1) below.

In the present text, departures from Lo are noted. Longer variant readings from Od have been recorded, the rest only selectively. The rubrics, from Lo, are in italics. Od lacks headings except "Proprietates planetarum et tabula eorundem", in Od₁ to §2-9.

(1) *Hic est tabula planetarum secundum magistrum Petrum de Dacia, Parisius facta.*

Horæ dierum	Dies Sabbati	Dies Jovis	Dies Martis	Dies Domin.	Dies Veneris	Dies Mercur.	Dies Lunæ
1, 8,15,22	Saturn.	Jupiter	Mars	Sol	Venus	Mercur.	Luna
2, 9,16,23	Jupiter	Mars	Sol	Venus	Mercur.	Luna	Saturn.
3,10,17,24	Mars	Sol	Venus	Mercur.	Luna	Saturn.	Jupiter
4,11,18	Sol	Venus	Mercur.	Luna	Saturn.	Jupiter	Mars
5,12,19	Venus	Mercur.	Luna	Saturn.	Jupiter	Mars	Sol
6,13,20	Mercur.	Luna	Saturn.	Jupiter	Mars	Sol	Venus
7,14,21	Luna	Saturn.	Jupiter	Mars	Sol	Venus	Mercur.

(2) Septem sunt planetae, scilicet Saturnus, Jupiter, Mars etc., et dicuntur planetae quasi sidera errantia, non quia errant, sed quia moventur contra firmamentum. Movetur enim firmamentum ab oriente in occidentem, planetae autem moventur ab occidente in orientem ex motibus suis propriis; moventur tamen ex raptu firmamenti, qui dicitur motus diurnus, ab oriente in occidentem, et ille motus non est naturalis eis sive proprius, sed accidentalis et violentus.

(3) Saturnus frigidus est et siccus atque malevolus, in rebus inferioribus malos faciens effectus, et maxime quando est in domibus suis, scilicet capricorno(-nio *Lo*) et aquario: tunc enim fiunt diluvia aquarum, ex quibus

procedunt caristiae, fames et mortalitates in terra. Cursum suum, hoc est 12 signa zodiaci contra motum firmamenti, percurrit in 30 annis, manens in quolibet signo duobus annis cum dimidio; et cum in quolibet signo sunt 30 gradus, patet quod in mense solari, quod est 30 dies, unum gradum pertranseat. (4) Jupiter calidus est et humidus, omnibus benefacit et nulli nocet, cursum suum in 12 annis peragens, in unoquoque signo manens per annum et in uno gradu circiter 12 (7 *Lo Od*₁) dies. (5) Mars vero in duobus annis totum percurrit (circuit *Od*₁) zodiacum, manens in quolibet signo 60 diebus, in uno (*Od*₁; *om.Lo*) gradu per duos dies naturales, et est calidus et siccus in excessu, et est malus, gaudens in homicidiis et combustione domorum et in guerris. (6) Sol est calidus et siccus, temperatus et bonus, herbas et arbores crescere et fructificare faciens; cursum suum in 365 diebus 6 horis et 13 minutis et 45 secundis peragit, et dicitur annus ab "an", quod est "circum", eo quod sol in tanto tempore totum circuit zodiacum. Ex 6 horis, quae supersunt (superfluunt *Od*₁) in anno, in 4 annis colliguntur 24 horae, quod est una dies, et ponitur dies illa in Februario super 6.Kal.Martii, et dicitur bis sexto (sex *Od*₁) Kal., quapropter dicitur annus ille bisextilis; et sunt in anno illo 366 dies (*Od*₁; *om.Lo*). Ex 13 minutis et 45 secundis insimul collectis in centesimo anno fit una dies, et ponitur in Decembri, et continet annus ille 367 dies. (7) Manet itaque sol in quolibet signo 30 diebus et 10 horis, ex quibus insimul collectis in anno fiunt 5 dies, quorum unus datur Januario, secundus Martio, 3us Maio, 4us Octobri, 5us Decembri; nisi enim essent illae 10 horae residuae, quilibet mensis aequaliter 30 dies contineret. Nec obstat de Februario et Augusto, quia, quomodocumque Iulius Caesar a Februario duos dies subtraxerit et mensi suo apposuerit, et Augustus Caesar mensem nomine suo intitulatum ex 31 diebus constituerit, non est credendum quod sol aut magis aut minus moretur in uno signo quam in alio: ipsi enim non potuerunt (*Od*₁; poterunt *Lo*) in motu caeli quicquam variare. (8) Venus est bonus planeta (et est lucidissimus temperate frigidus et humidus *add.Od*₁), Mercurius cum bonis bonus, cum malis malus; et habent fere eosdem motus cum sole, modus tamen movendi est alter in ipsis et in sole (modus--sole *om.Od*₁). (9) Luna est infima planetarum, in cursu suo omnium velocissima, frigida et humida, plus se inclinans ad bonum quam ad malum; in 27 diebus et quasi 8 horis omnia signa pertransit, manens in quolibet signo duobus diebus naturalibus et fere 8 horis; in die naturali 13 gradus et 10 minuta percurrit.

(10) Habent itaque planetae alios cursus in 7 diebus septimanae, quia planeta, qui dominatur in prima hora diei, habet supereminentiam domini in die illa, et ab ipso denominatur; alii tamen planetae vicissim, quilibet post alium secundum ordinem, in horis suis dominantur. Verbi gratia, Saturnus in die Sabbati habet primam horam, Jupiter secundam, Mars 3am, Sol 4am, Venus 5am, Mercurius 6am, Luna 7am; accedit iterum Saturnus, 8am sibi assumens, Jupiter 9am, Mars 10am, Sol 11am, Venus 12am, Mercurius 13am, Luna 14am; 3^o redit Saturnus, capiens 15(am), sicut patet in tabula.

(14) *Consequenter hic sequuntur (ex sequitur corr.Lo) expositiones signorum secundum praedictum magistrum Petrum de Dacia.*

Multum prodest scire in quo signo (et in quo gradu signi *add. Od₁ Od₂*) est luna omni die, quia ipsa secundum Ptolomaeum in Almagesti in istis inferioribus ceteris planetis maiorem habet efficaciam, tum ratione propinquitatis eius ad terram, tum ratione velocitatis eius in cursu suo. Ipsa enim omnibus planetis est inferior et terrae proximior nec non (no *Lo*) et in cursu velocior, quia omni mense omnia signa percurrit et virtutem seu influentiam, quam a superioribus planetis vel stellis fixis recipit, terrae per radios suos refundit, et sic participat in virtute omnium planetarum et stellarum fixarum saltem dum eis coniungitur, nisi per aspectum alicuius alterius impediatur vel saltem minuatur. Ad ipsam igitur lunam praecipue, et ad signum quod ascendit nostrum (*om. Od₁ Od₂*) in oriente in hora operationis, debemus inspicere in factis nostris notabilibus.

(15) Quando luna est in ariete, bonum est loqui cum nobilibus potentibus, et exire (*exiere Lo*) ad pugnandum, et iter incipere versus orientem, mercimonia facere, cambire aurum, et operari omnia quae cum igne fiunt, et omnia facere quae cito vis fieri; exceptis istis, quod malum est caput lavare, radere, medicari; sanguinem de naribus minuere, exire de carcere, de aegritudine convalescere, matrimonium contrahere, religionem intrare, purgationem accipere, sicut in omnibus signis ruminantibus, prout sunt aries, taurus, leo, capricornus, et ultima pars sagittarii (et omnia facere quae debent diu durare *add. Od₁*). Idem dico quando aries est ascendens in caelo (*idem-caelo om. Od₁*). **(16)** Quando luna est in tauro, bonum est facere societatem et pactum, et de pace inter inimicos tractare, domos fundare, castra et possessiones novas intrare, dominium alicuius rei recipere; terras, vineas colere, seminare et plantare; uxorem ducere, et omnia facere quae diu debent durare; exceptis istis, quod malum est iter longum incipere, bellum vel placitum; in carcere poni, in aegritudinem cadere, coram domino vel iudice ire causa impetrandi gratiam, medicinam in collo vel gutture facere, et ibidem vulnerari, vel omnia facere quae cito vis fieri. **(17)** Quando luna est in geminis, bonum est iter incipere, et loqui cum parentibus et amicis et quibuscumque personis, et etiam cum inimicis si necesse fuerit; mulierem affidare, sed non ducere; societatem facere, pactum novum, et etiam mercimonia. Malum est sanguinem de brachio minuere, de carcere exire, religionem intrare, de aegritudine convalescere, et omnia facere quae diu debent durare. **(18)** Quando luna est in cancro, bonum est ire per aquam, et omnia facere quae de aqua vel per aquam fiunt, accipere purgationem, mercimonia facere, monetam in (*et Od₁*) argentum cambire, et omnia facere quae cito vis fieri. Malum est domos fundare, castra et possessiones novas intrare, matrimonium contrahere, religionem intrare, exire de carcere, de aegritudine convalescere, et omnia facere quae diu debent durare, et etiam medicari pectus et pulmonem(-one *Lo*). **(19)** Quando luna est in leone, bonum est loqui cum regibus et nobilibus (et iudicibus *add. Od₁*) et eorum loca tenentibus, operari in auro et illud (*Od₁*; eum *Lo*) cambire, mercimonia facere, et omnia facere

quae de igne vel per ignem fiunt, dominium alicuius rei recipere, domos aedificare, castra et possessiones novas intrare. Malum est vestimenta nova induere, sumere (suere *Od₁*) vel incidere; bellum et placitum incipere, iter longum arripere, in carcere poni, in aegritudinem cadere, et omnia facere quae cito vis complere. **(20)** Quando sol est in leone, tunc valde est intensus calor, et sunt dies tunc caniculares: est enim canis, a quo denominantur (*Od₁*; *domin- Lo*) dies illi, quaedam parva stella in ore leonis, calidae et siccae complexionis; unde cum sol, qui fons est caloris, tunc est in leone qui iterum est calidus et siccus, constat quod tunc temporis regnat calor superfluum, qui sine siccitate esse non potest, eo quod omne simile suum simile augmentat. Et propter hoc dicit Hippocras in Amphorismis: "sub cane et ante canem molestae fiunt purgationes" propter defectum humoris, quapropter cavendum est in diebus illis ab omnibus, in quibus est evacuatio humorum: sanguinem minuere, coire cum muliere. **(21)** Quando luna est in virgine, bonum est emere pannos et iocalia; terras colere, et seminare, arbores et vineas plantare, iter breve incipere, sed non longum, emere animalia quae non equitantur, famulos conducere, societatem et pactum facere et mercimonia. Malum est in carcere poni, in aegritudinem cadere, virginem in uxorem ducere, quia vel sterilis erit vel paucos habebit filios; secus autem est de corrupta (*secus-corr. om.Od₁*). **(22)** Quando luna est in libra, bonum est mercimonia facere, fodere et terras colere, et omnia facere quae cito vis complere. Malum est iter longum incipere, ne forte inimicos vel latrones in via invenias; ad pugnandum exire, proelium vel placitum incipere, matrimonium contrahere, societatem aut pactum incipere (*matrim.--inc. om.Od₁*), et omnia facere quae diu debent durare, exire de carcere, de aegritudine convalescere, religionem intrare, dominium alicuius rei recipere. **(23)** Quando luna est in scorpione, optimum est purgationem accipere et balneare. Malum est medicari (*purgare Od₁*) anum et pudibunda, tam mulieris quam hominis, atque matricem; iter, bellum vel placitum incipere; et omnia facere quae cito vis complere. **(24)** Quando luna est in sagittario, bonum est iter incipere versus orientem, medicinam accipere, praeterquam in ultima facie eius (*iter--eius: terras colere et seminare, arbores et vineas plantare et omnia facere quae de igne fiunt, mercimonia facere, per terram ire Od₁ ex inferioribus*), cum potentibus et iudicibus (*nobilibus Od₁*) loqui et maxime cum personis ecclesiasticis, mercimonia facere, cambire aurum, et facere omnia quae de igne fiunt; matrimonium contrahere, intrare religionem et beneficia ecclesiae, peregre proficisci, litteras et nuntios longe mittere. Malum est montes et loca alta ascendere, et medicari crura, et facere quae spectant ad aquam. **(25)** Quando luna est in capricorno, bonum est terras colere, seminare (*om.Od₁*), arbores et vineas plantare, et omnia facere quae de terra (*igne Od₁*) fiunt; mercimonia facere, per terram ire, cum nobilibus et potentibus loqui et quibuscumque iudicibus, dominium vel magnorum dominorum servitium intrare, possessionem novam vel domum novam. Malum est purgationem accipere, et genua medicari, et omnia facere quae cum igne fiunt. **(26)** Quando luna est in auario, bonum est ire per aquam, loqui cum amicis et aliquid petere ab eis, uxorem ducere, religionem intrare, domos fundare, hereditates emere, dominium vel possessionem novam vel

servitia magnatum intrare, cum nobilibus vel potentibus loqui. Malum est iter longum incipere, bellum et placitum similiter, quia nimis durarent, et omnia facere quae cito vis fieri; medicari tibias, vel in ipsis laedi seu vulnerari. Idem dico quando aquarius ascendit in oriente. **(27)** Quando luna est in piscibus, bonum est purgationem accipere, praebendas vel dignitates ecclesiae de novo intrare, et cum personis ecclesiasticis loqui, et cum mulieribus; equos emere et magna animalia; ire per mare; matrimonium contrahere, si luna fuerit in augmento; si autem in decremento, non. Bonum est mercimonia facere, et omnia quae in aqua vel per aquam fiunt, sicut molendinum, aquae ductum (a.d.: aquaticum *Od*₁), piscare, et similia. Malum est alicui pecuniam praestare, depositum locare, petere debitum a debitore, in carcere poni, in aegritudinem cadere, bellum vel placitum incipere, quia tam carcer, bellum, aegritudo, et placitum (tam--plac. *om.Od*₁) nimis durarent; iter versus meridiem incipere, et omnia facere quae de igne fiunt; medicari pedes vel eorum cavillas, sicut (aut *Od*₁) in gutta podagrica, et in pedibus vel in eorum partibus laedi vel vulnerari. Idem dico de hoc signo, et de omnibus aliis, quando ascendunt in oriente.

(28) Et nota quod quando luna est in signis terreis, sicut sunt taurus virgo et capricornus, tempus naturaliter debet esse spissum, hoc est nebulosum, quia tunc nubes discurrent per aerem sine pluvia vel cum modica pluvia, et consuevit ut plurimum esse nebula, nisi per corporalem praesentiam vel per aspectum alicuius alterius planetae vel stellae fixae impediatur. Et quando luna est in signis aqueis, sicut sunt cancer scorpio et pisces, ut plurimum est tempus pluviosum vel saltem frigidum et humidum, quantum est de natura signi, nisi per alterius aspectum reprimatur. Quando luna est in signis aereis, sicut sunt gemini libra aquarius, tempus debet naturaliter esse calidum et humidum et instabile, quia ut plurimum nunc pluit, nunc est (*Od*₂; *om.Lo*) clarum; plus tamen se (*Od*₂; *om.Lo*) inclinatur ad claritatem, nisi per alterius aspectum reprimatur. Quando vero luna fuerit in signis igneis, sicut sunt aries leo sagittarius, tempus naturaliter debet esse clarum et pulcrum. Quando tamen luna transit per flancos (fauces *Od*₂) leonis, aliquando pluere consuevit vel saltem esse nebula, nisi per aspectum seu praesentiam corporalem alterius planetae vel stellae fixae virtutem contrariam habentis hoc impediatur. Explicit.

(c) The planetary tables most commonly headed *Tabula ad sciendum quis planetarum regnat in qualibet hora diei (et noctis)* have 7 columns for the days of the week, nearly always beginning with Sunday, and mostly 24 rows for the (unequal) hours of day and night, beginning at sunrise. Within each column, and continuing from one column to the next, the planet names are entered according to the cycle Sun, Venus, Mercury, Moon, Saturn, Jupiter, Mars. Thus, equivalent tables can be made consisting of 14 or 7 rows with the entrance column of 24 hours appropriately telescoped; such tables are also often found (cf.,

e.g., this App.(a)§57;(b)§1). One further type, for the 12 hours of the day, is the upper half of the 24-row version. All these types can have a heading like that cited, and are commonly followed by the verses "Jupiter atque Venus boni sunt. . ." and "Frigidus et siccus Satur. . ." (=this App.(a)§48), or by the prose note "Jupiter et Venus sunt boni. . ."; for details on these points the descriptions should be consulted.

Examples of canons to these tables can be found in this App.(a), preamble and §56, and (b)§10. Several others occur, including the extract from Sacrobosco's *Computus* in Le,19v+, but no recurrent ones have been found. In (c1) below I print that of Re.

I have seen a similar table in a set of glosses on Sacrobosco's *Computus* (e.g. Princeton U.L., Garrett 99,140r; Stockholm,K.B., X 767, p.84; Paris, S.Geneviève, 1043, 13r; all from the late 13th or early 14th c.); that table has 24 rows, and columns for Saturday-Monday only. A table with 14 rows appears to be incorporated in the "anuli Salomonis" of Pd,106r-v, with a reference to Alchabitius. Elsewhere I have only seen such tables in connexion with Peter Philomena's *Calendar* or later ones, or in collections of texts also found with these calendars. The only ascription to Peter remains the one found in Lo (this App.(b)). It is certain that more could be done to trace this table.

In the references below, "c" denotes a canon other than the verses, etc., already cited.

The tables found in fairly close connexion with Peter's *Calendar*, or cognate texts, are of all four types mentioned, as follows: *24 rows*: A,14r; Mj,10r; O4,73v; X,9v (with a note delimiting the 12 hours of day-light); Om,42v(c); Bs,16v. *14 rows*: Pd,65r; Pe,42r-v (c, in French). *7 rows*: S,21r; cf. this App.(a) §57, and (b) §1 where the table is ordered peculiarly. *12 rows*: Re,7v (c, in French); D,15r-v (with all 24 hours in the entrance column); O5,236v. These examples do not indicate that the table, or any particular form of it, is regularly present in central parts of the tradition of the *Calendar*.

The remaining instances occur in varying contexts. *24 rows*: P1,31r (with Peter's *Calendar* and two others); Md,77v(c) and Ml,150v (in miscellany with *Calendar*). In British manuscripts and/or with British calendars: Ew,42v(c); Ny,15v(c); Lr,32r; Ln,33v+(Catalogue); Le,19v-20r(c); cf. Edinburgh,U.L., 126,8r (to a calendar dated 1482; ref.

O.Pedersen 1976,32). 14 rows: W,69r (in miscellany following Calendar); E2,71v (with T.L. and calendar App.5(j4)); Pr,23v (with calendars of Peter and John Somer); Kh,162v-163r (c, ref. to Alfarganus) and 222v (contexts undetermined). 7 rows: Ba,148v(c) (in miscellany, different authors); Bf,14r(c) (also near calendar of John of Gmunden); the hour-values in both of these happen to have been truncated at 21^h. 12 rows: W,57v (in miscellany preceding Calendar).

For various other forms or remains of them, most of them not closely connected with the Calendar, see N,70r; Pc,58v; Ef,199v; Bv,19r; Pf,55r(c).

(c1) Manuscript: Re,7v. To a planetary table with 12 rows, cf. description.

(Hdg.): Ch'est a sauoir quel planete regne a chacun heure du iour. (Txt:) Se vous voules sauoir quel planete regne a chacun heure du iour, premierement deves sauoir en quel iour vous estes, et queres 1 autel iour en la table des planetes, et puis resgardes quel heure il est par le quadrant. Et queres une autele heure en la table des planetes, et vous la troueres en la premiere ligne vers la main senestre. Et quant vous aures trouee vostre heure en vostre table, resgardes de sous ce mesme iour ou vous estes en contre sele mesme heure, et dites tel planete regne a tel heure de ce mesme iour, et ainsiut en suiuant.

(d) *Excerpts of moon-books, planet-books, and canons to sign-men, occurring more than once.*

The contexts in which these pieces occur should be sought under the descriptions of manuscripts. Since the texts are generally extremely labile, I print each of them from one manuscript to save space, mostly ignoring variants and tacitly introducing a few strictly necessary and obvious corrections.

(d1) T&K 1205,1236,133; Zinner 1925,8082-7. Text from P3,96v (end apparently lost). Other manuscripts: Y,296va-297vb(a-h; end lost); Ny,21v+(a-c,d-f); Oa,152v+(a); Kt,10v-11v(a-b in French with extensions on ancient authorities and medical advice); Bs,4r-5r(abbreviation of d-e as a gloss on (d6) below); Le,14r-17v(a-b, and c-e paired with the corresponding sections of (d2) below); Pd,33r-37v(d-e plus the pieces from (d2) below). More manuscripts in T&K and Zinner,

apparently of widely differing lengths. For a text similar to (c-e) see Svenberg 1963,88-92 (Vat. Urb. Lat. 1398, 23r, 15th c.)

(a) Qui cursum lunae recte scire desiderat, sciatur primitus quomodo sol per signa vadit. Sol namque in quolibet anno pertransit omnia signa, morando in quolibet signo 30 diebus. Signa vero 12 sunt, videlicet ista, scilicet aries taurus etc. Per ista 12 signa in unaquaque lunatione currit et decurrit autem luna, et transit in 30 diebus omnia signa, manens in unoquoque signo 2 diebus et 8 horis; currendo per signa pervenit ad signum et gradum, in quo sol est, et tunc iuncta cum sole dicitur esse in combustione, ibidemque perficit cursum suum. . . si luna renovatur a medio mense Martii usque medium mensem Aprilis, tunc luna initium habet a signo arietis, et sic de ceteris signis. - (b) Multum enim prodest scire in quo signo sit luna omni die, quoniam luna est aliis planetis terrae proximior et rebus mundi plus aliis praestat effectum suum, secundum naturas et coniunctiones signorum per quae discernitur (?discurrit). Bonum est enim statum lunae cognoscere, quia possumus per hoc scire, quid sit bonum incipere et facere, et quid non. Possumus etiam per hoc cognoscere quale tempus debet esse, naturis signorum et coniunctionibus semper consideratis. De quibus breviter de unoquoque signo, et de luna cum est in aliquo signorum, per ordinem et aperte dicemus.

(c) Aries quoque habet caput et faciem et pupillam oculi et intestina, et quidquid accidit in eis et in oculis atque auribus ex infirmitatibus. - (d) Cum quidem luna fuerit in ariete, signo orientali calido et sicco, igneo colerico et masculino, bonum quoque est iter versus orientem incipere, et ad illam partem ad mercandum ire, et qui tunc in illam partem incipit iter, bene et cito complebit. Bonum enim est incipere vel operari quidquid cum igne fit; bonum quoque est sanguinem de brachio minuere, balneum intrare, et omne opus incipere et facere quod vis cito finire nec multum durare. Malum enim est caput lavare ac medicare, radere quoque, vel ventosas in collo ponere, et sanguinem de naribus minuere, ac uxorem ducere, domum vel castrum fundare, et dominium de aliqua re intrare, de carcere exire, cartam de possessione facere, quamvis permanere dicatur. Et quoniam aries est animal ruminans, medicina non accipiatur cum luna est in ariete, quia si accipiatur evomitur. In omnibus enim signis ruminantibus, ut aries taurus capricornus et ultima pars sagittarii, potio vel medicina non debet dari quia, si quis eam susceperit, evomet. Idem dicendum est de omnibus signis quae consurgunt ab oriente. Cum enim hoc signum surgit ab ortu, tempus dat calidum. - Taurus. . . (e) Pisces. . . Tempus vero dat aquosum frigidum et humidum.

(f) Signa quidem tropica sunt 4, scilicet aries cancer libra capricornus, quae ideo dicuntur tropica sive mobilia quia, sol cum ingreditur istorum signorum initia, mutatur tempus ad temporis substantiam sequentis, †quando enim ipsorum conversiva motione ab alia natura instituitur† dum sol principia eorum invadit. - Signa quoque fixa. . . Signa vero communia. . . prima frigida et sequens calida.

(g) Quousque de 12 partibus caeli compendiose ubicumque auctorum sententiis ordinavi; nunc autem de 7 planetarum naturis aliqua breviter

scribo. – **(h)** Sunt itaque 7 planetae, quae dicuntur sidera errantia, quae sunt (?quia secundum) omnium artium magistra (?-am), sicut et praedicta 12 signa, hos 7 planetas posuit deus omnipotens super isto caelo sidereo, ut moverentur contra ipsum ad retardandum firmamenti velocitatem, ita tamen ut numquam exea<n> latitudinem orbis signorum. Inter has 7 (7 h. P3) stellas sol quasi rex existit medius, et tamquam [quasi] fons luminis <et> caloris cuncta illuminat et calefacit super se opposita et etiam (*inv.*P3) subtus se ordinata; a quo maxime temporum habemus diversitatem, ut annus mensis et dies. **(j)** Sed pri<m>us horum 7 planetarum, descendendo inferius, est Saturnus, qui est planeta frigidus et siccus atque malevolus: ideo in rebus mundi malos habet effectus. Iste dum est in domiciliis suis, scilicet in aquario et capricorno, multa mala fiunt in orbe, maxime quando est in prima domo, scilicet in aquario: tunc enim fiunt magna diluvia in terra, et odia in gentibus implacabilia. Iste planeta mense primo conceptionis frigiditate sua conceptum infrigidat, in matrice coagulat et desiccat. Et quia ex coloribus habet nigredinem, facit saturnianum esse fuscum, paucos pilos in barba et in maxillis, qui cum ambulaverit, in terra oculos mergit; et est macer, habens oculos parvos et cutem siccam; est iracundus, venenosus, noxius, turpis, ingeniosus tamen circa artes viles et graves, ut est fodere terram, ru<m>pere lapides, construere domos, conducere aquas, et huiusmodi. Callidus est, aliud ore sonans, aliud corde machinans. – Planeta secundus est Iupiter. . . **(k)** Luna in omnibus aliis planetis est inferior, septimus a Saturno, et terrae proximior, frigidus et humidus, et receptio est omnium dispositionum, quia mutat, ut dicitur, esse suum ad planetam cui adiungitur; et est delatrix omnium planetarum, quia defert dispositionem unius planetae ad alterum; omniumque planetarum qui supra se sunt naturam recipit, quia omni mense omnia signa et planetas requirit, et quod a singulis recipit †iniectus† inferius in terra radiis et <in> ipsa[m] stantibus refundit. Ad solam ergo lunam debemus respicere in factis agendis, quia ipsa (-se P3) teste Ptolomaeo, cum terrae proximior, in rebus mundi maiorem efficaciam habet. Luna mense septimo conceptionis dat plasmati pulmonem et dividit membra per loca sua. Et si puer tunc nascitur, erit vitalis, quia omnes planetae sunt in eo omnem suam potentiam operati; si autem octavo mense nascitur, non vivet, quia fit retroversio ad Saturnum qui, ut supradictum (super P3) est, sua frigiditate et siccitate membra concepti astringit. Nono autem mense (sexus *add. et del.* P3) natus vivit, quoniam regnat in eo Iupiter qui, ut dictum est, nulli nocet sed omnibus benefacit. [Luna] lunarii (-ios P3) nulli<u>s esse servitii, sed semper ire vagando desiderant, et sunt nuntii, nugarumque et rumorum reguli, et aliorum servitiis occupati; habentque unum oculum maiorem altero, et raro accidit quin sint strabi et in uno oculo laesi. Sunt autem lunarii venditores mellis et olei et ficus et dactilorum et huiusmodi.

(l) Ex ipsis 12 signis, ut communis astrologorum auctoritas testatur, sunt sex feminea et sex masculina, et [non] similiter succedit masculinum femin<e> et femin<e>um masculino usque in fine signorum. – Quattuor ex eis dicuntur tropica et conversiva sive mobilia, scilicet aries cancer libra et capricornus, quae ideo dicuntur tropica sive mobilia quia, sol cum ingreditur istorum

signorum initia, mutatur tempus ad temporum substantiam sequentis temporis †conversiva mutatione ab alia natura instituit† dum sol principia eorum invadit. Luna quoque, cum est in istis tropicis signis, omnia citius alternat negotia, unde odium et inimicitia vel adversitas instabile est et inconstans; aedificiorum fundamenta locare vel castra et civitates construere penitus inutile est, nec fieri debent, quoniam instabilitas lapsum tunc minatur. Luna cum tropicis signis, si quis aegrotus fuerit, morbi diuturnitatem negat. Dissensiones et iurgia in conversivis nec firma sunt nec diuturna. Vendere autem et emere penitus inutile est quoniam, si qua ementur, non permanent diu apud emptorem: fraude namque et dolo persaepe ac violentia[s] compleri solent. Data et accepta beneficia minime prosunt. Quidquid boni <vel> adversi recurrat, non diuturnum est nec stabile. Si quid promittetur (per- P3), non datur; vel si datur, multum accipienti durat. Medicus non curat super eis, nec convalescit aeger ad plenum, quia denuo recidivabit. Scito enim quod signa tropica vel mobilia sive conversiva rerum mobilitatem significant, fieri festinanter, et nihil durabile fit in eis, nec tempore eorum prolonga[n]tur. Non itaque aliquid est incipiendum in eis quod volunt multo tempore permanere stabile; sed omne, quod instabile et festinosum volunt, sub eis incipiatur. Si de carcere exierit vel fugam quis inceperit, cito recaptus erit; quod si quis perdat rem, invenit. Connubiorum et amicitiarum vincula si firmantur, stante luna in tropicis, dissolventur; est autem bonum et amicitias et connubia incipere et tractare, sed bonum est in signis firmis firmare. – Signa quoque firma. . . (P3 ends in this section.)

(d2) T&K 131. Text from T,181r. Other manuscripts: W,58v-59r; Le,14r-17v (conflated with (d1) above); Pd,33r-37v (somewhat extended, also paired with (d1)). W and Pd begin with Aquarius. The present text is related to (d4) below.

Aries est signum mobile, calidae et siccae naturae, et dat esse mediocris staturae et pulchrae, habentem scapulas strictas, coxas longas et longum collum et longam faciem et pedes magnos et mentem subtilem et brachia subtilia et nasum subtilem et capillos multos et subtiles, et pulchrior est retro quam ante, et oculos magnos et curvum corpus, et duas dentes superiores ceteris maiores et divisos, et animum levem, et honeste euntem. Bonum est facere ad mobilitatem (W; nob- T), et bonum esse ire ad balnea. – Taurus. . . Aquarius est signum firmum, calidae et humidae naturae, et dat hominem esse mediocris staturae, habentem rotundam faciem. . . (W, *def.T*.) Pisces est signum conversivum (corporeum W), frigidae et humidae naturae, et dat hominem esse pulchrae staturae, habentem amplum pectus. . . loqui cum pugnatoribus. Pedes non medices.

(d3) T&K 314,315? Text from L,9r. Also in W,67v-68r. Both connected with a 12×12 lunar table and the canon App.4(a4).

Cum luna est in ariete, bonum est minuere sanguinem in brachio, et balnea intrare, et iter incipere ad omne negotium, et facere cum festinatione. Medicinam capiti adhibere non est bonum. – In tauro. . . In pisce bonum est accipere medicinam, et tractare de his quae pertinent ad pacem. – Praeterea sciendum est quod, quandocumque luna est in fine geminorum et cancri et librae, et in scorpione et in aquario et in pisce et in omnibus praedictis locis, aer mutatur ad pluviam, et tempus non disponatur (W; ? L), et mare in his temporibus incipit ingrossari. Et haec de signis sufficiant.

(d4) T&K 130. Text from W,70v-74r. Also in Mj,13r-27r, from which the corrections have been taken unless otherwise noted. The Jo. de Restail in the subscription of W may be the scribe.

Aries est primum signum caeli «que» zodiaci, domus diurna (diuina W) Martis, exaltatio solis (saluus W), masculinum, mobile, calidae et siccae naturae ut ignis, quare dicitur igneum, colericum; orientale, eo quod eius virtus et potestas plus est in parte orientali quam in alia. Dominatur naturaliter capiti ac ipsum quandoque bullat de virtute suae proprietatis. Et facit hominem mediocris staturae et pulchrae convenienter, habentem faciem longam et quasi mentem subtilem, collum longum vel scapulas quasi strictas, brachia subtilia, nasum subtilem, vel quasi multos capillos, coxas longas vel quasi macras, pedes magnos, corpus curvum, oculos mediocres, duos dentes superiores ceteris maiores et aliquantulum divisos, mobilis animi, honestae essentiae (euntem Mj). Et quando vadit, multum respicit in terra. – Luna morante (-ans W) in eodem signo, bonum est facere quidquid pertinet ad mobilitatem, ut incipere iter (aliquid W) per terram, mutare locum, id est stationem, per terram, intrare balneum, id est stupam, incidere ungues <et> vestimenta nova et ea sarcire et induere, et tractare de nuptiis et de pace seu concor<dia> litigantium, loqui de amore ad mulierem, petere dilectionem, facere experimentum ad amorem habendum, ire ad rectorem loci, pannos rubeos comparare et omne genus armorum, ut scutos, enses, loricas, aes, cuprum, equos bellicosos et principaliter rubei (-eos W) pili; tollere servos et ancillas atque animalia, ut oves et capras, canes et falcones; vendere vel plumbum et ferrum et margaritas; fundare habitationem, ut furnum et fornacem et coquinam et fornacellam, fornellum; incipere studium, et vinum statuere ad vendendum, praestare pecuniam, locare depositum, «et» addiscere artem, et facere societatem cum altero. Cavendum ne tondantur capilli, ne rad[i]jatur caput, ne medeatur apostema capitis, nec sanguini]s extrahatur, nec scolare (scotare Mj) aures, nec medicare caput, nec ducere uxorem, nec plantare arbores nec vineam. Et quando sol et luna intrant illud signum, tempus naturaliter (Mj; vel W) mutatur in ventum vel in serenitatem ac calorem.

Aries est primum signum caeli, et dicitur mobile naturaliter calidum et siccum, masculinum orientale colericum, et cuius stellae sunt calidissimae, et ob hanc causam omnis planeta in eo signo recipit ab eo augmentum caloris,

et aer magis fit calidus, et quando aliqua stellarum intrat, tempus mutatur ab esse in esse. Verum est quod talis calor secundum naturam et proprietatem ipsius planetae magis apparet (m.a.:Mj; nig() W) ut si est calidus, minus ut si est frigidus: calidus ut Mars et sol, frigidus ut Saturnus. – Hoc quidem signum est bonum, domus Martis, exaltatio solis, et casus Saturni. Igitur quando Mars est in eo, gaudet regnat et dominatur sicut homo in propria domo. Quando sol est in eo, gaudet regnat et dominatur sicut magister in cathedra, rex in solio, episcopus in sede sui honoris, prior ordinis in loco sibi deputato. Quando Saturnus est in eo, tristatur multum, quia est in suo casu tamquam princeps eiectus de suo honore excellenti, et est similis homini confinatus in extranea provincia, et ibi perdit suas vires; tamen, quando est in ariete tempore veris, valde infrigidat aerem, claudit poros terrae arborum herbarum ac hominum in suis corporibus, cuius <causa> multae tardantur res in suo augmento, et venti non habent multam potentiam spirandi fortiter (-tis W). Et quando luna est in ariete, confortatur <aer> et siccatur humiditas eius [cuius aequum] (c.a. om.Mj) et serenatur, et ventus fortificantur (ferociter W) ad spirandum per orbem. – Hoc quidem signum habet multas stellas parisimiles (parissibiles Mj), dispositio quarum sic certificatur: In quolibet cornu eius (c.e.: Mj; est W) una. In fronte 1. In naribus 3. In collo 2. In dorso 4. In ventre 3. In summitate cuiuslibet pedis unam. In cauda unam. Et haec est forma sui aspectus in caelo. – Conceptus vel natus sub hoc signo secundum proportionem gradus ipsius erit complexionatus corpore et fortunatus ad habendum de rebus bonis et malis. Igitur si sub prima <facie> (parte Mj; om.W), erit (erat *Wp.c.*) calidus et siccus, colericus macilentus audax fortis vanus superbus clamosus furiosus; timebitur amabitur (ambitus W), divitiis abundabit (-antibus W), ad honores perveniet. Si 2^a facie, erit bonus pius debilis pacificus ac utilis et infortunatus. Si sub tertia facie, erit bonus mitis (iustus Mj).

Taurus est 2^m signum caeli zodiaci. .Pisces est 12^m signum caeli, commune naturae, frigidum et humidum, femineum septentrionale . . .Pisces est 12. signum caeli zodiaci, domus Iovis in nocte, cuius regimini aer fit turbidus pluvialis. . .piger vel quasi facile pavidus et timidus, vanus (et constans W) et inconstans. (*W*): Expliciunt dicta et naturae 12 signorum, completa Aquis per manus Iohannis de Restail, anno domini 1^o3^o4^o9^o in die sancti Matthaei apostoli et evangelistae. (*Mj*): Explicit tractatus de 12 signis.

(d5) T&K 569 (with attribution of *(a)* to Gerlandus, presumably on the basis of the *Contratabula Gerlandi* at P1,32v). Text from P1,28v-30r (*d,b,c*) and 31v-32r (*a*). Another witness is N,70r-v, containing *a,b,c*, and a shorter version of *d* much like Svenberg 1963,78-9 (from a ms. of the 12th c.).

(a) Frater Vincentius, si quis a me quaerit quis sit effectus proprius planetarum omnium, respondeo qua brevi potero narratione, comprehen-

dens uniuscuiusque planetae quosdam effectus proprios secundum quod philosophi invenerunt eos, certis experimentis et rationibus necessariis approbatos. – Dico ergo quod sol est calidus siccus colericus igneus masculus aureus, regnandi cupidus. . . Reliquorum autem planetarum proprietates, ut vitem prolixitatem, absque expositione narrabo, quia perito in naturis et astronomicis sufficiunt quae dixi in ex⟨ponendo⟩ proprietates solis ad exponendum proprietates reliquorum. – Est Saturnus frigidus et siccus, accidentaliter tantum humidus, et terreus melancholicus plumbeus obscurus, amans vestes nigras, tenax religiosus agriculor. – Iupiter. . . Luna est frigida et humida, fleumatica feminea argentea, mediatrix mundi superioris et inferioris, amans geometriam et quidquid ei attinet, rotunda facie, mediocris staturae.

(b) Quattuor sunt tripli⟨ci⟩tates signorum: prima constat ex ariete leone et sagittario, et est calida sicca et colerica; secunda. . . quarta. . . fleumatica. – Signorum quaedam sunt ignea orientalia, ut aries leo sagittarius; alia aerea. . . alia terrea meridionalia, ut taurus virgo capricornus. Unde ignea sunt colerica. . . et terrea melancholica.

(c: to a sign-man, missing in N:) Notandum est quod aries tenet caput et faciem. Taurus. . . Piscis tenet pedes et cavillas et plantas pedum. Et hoc patet in ista figura istius hominis. Explicit.

(d) Luna existente in ariete non radas caput, nec sanguinem per ventosas a cervice extrahas, nec mediceris ea quae ⟨ad⟩ caput pertinent, ut auribus oculis et aliis huiusmodi. Tamen de brachio minui aut balneum ingredi utile est. Est autem signum mobile masculinum igneum colericum orientale diurnum amarum, valde bonum. Cum oritur, tempus dat calidum et fuscum. – Luna existente in tauro. . . Luna existente in piscibus iter arripere, potionem accipere bonum est. . . mediocriter malum. Cum oritur, tempus dat aquosum frigidum et humidum.

(d6) T&K 912 (from the Regimen Salernitanum). Svenberg 1963,15. A version of the whole text is in this App., (a)§27-38. Other manuscripts: P1,27v; L,9v; Pn,1r-v; Bs,4r-5r(with a gloss, cf. (d1) above); Kh,154r(to a sign-man); S(incorporated in a prose work ending at 19v). Very common.

Nil capiti facies, aries cum luna refulget. . .
Carpe viam tutus, fit potio sumpta salubris,
Embryo conceptus epileuiticus exit ab alvo.

(d7) T&K 475. Canon to a sign-man. Printed in Sudhoff 1914,211. Text from A,14v. Also in T,188v; Mj,12r; Om,42r; Oa,160+(Cat.). Texts beginning approximately as the present one, but longer and without sign-men, are in Bf,5v; O5,233v and 234r-v; Bu,9ra-vb; cf. (a) above, preamble and §26ff.

For the sign-man cf. Bober 1948,16-7 and Pl.5(a-d), showing the sign-men of Om, Mj, and of Pn,2r(apparently without a canon) and Kt,12r(with its own canon in French). See also this App., (a)§11; (d5c); (d8) for sign-men with other canons.

(Hdg.): *Dominium signorum.* (Txt:) *Duodecim sunt signa, scilicet aries, taurus. . .aquarius, pisces. Et quia aries in prima mundi constitutione coepit vergi, inde est quod caput hominis habere dicitur. Taurus habet collum et guttur. . .Pisces habet pedes. Et ita membra humani corporis per signa supercaelestia dividuntur. Luna existente in signo membri patientis, nullum medicamen facias illi membro.*

(Addition in A, not in Mj:) *Aries leo sagittarius sunt signa calida et sicca, et sunt de natura solis et Martis.* (Subscr.>) *Orientalia.* (Txt:) *Taurus virgo capricornus. . .*

(d8) T&K 129. Canon to a sign-man. Printed in Sudhoff 1914,212, who cites Cd and some other mss. in England. Cf. Bober 1948, 24 and Pl.9b(from a ms. of Nicholas of Lynn's calendar). Text from Le,18r. Also in Cd,1r(with a calendar, cf. App.5(j7)).

Aries. Cave ab incisione in capite vel in facie, et ne incidas venam capitalem. Taurus. . .Pisces. Cave ne incidaris in pedibus vel venis eorum (v.v.e.: dum ibi manet luna, scilicet februario et martio, et sol Cd).

(d9) Svenberg p.80 (from Paris B.N., n.a.1.299, 13th c.). Text from P3,96r. A similar text in Sx,1v-5r.

Martius. Cum quidem luna fuerit in ariete, bonum est versus occidentem tendere, et bonum est scribere texere, per mare navigare, arma manus(!) componere, fabricare quoque [[cum calce, ?muros facere]] «et omnia quae ad ignem pertinent operari» fenum secare, et omnia facere quorum finis cito desideratur. Et est malum incipere rem stabilem atque firmam, ut coniugium vel societatem; aedificare quoque malum est turrim castrum vel domum. [[?Malum intrare in tenutam]] «Malum quoque est intrare in dominium vel in domum aut in tenutam alicuius rei. Tempus dat calidum atque pulchrum. -Et malum est medicari caput, quia qui tunc vulneratur aut <?>, morietur. Laesio aut debilitas semper in capite remanebit. Bonum autem est omnia, quae in igne vel cum igne vel ad ignem pertinent, operari.» - Cum quidem luna fuerit in tauro. . .Cum luna fuerit in pisc(). . .tempus dat nubilosum vel aquosum.

(d10) Some lesser notes, and texts occurring only once, are briefly recorded below. Excerpts of most of them can be found in the

descriptions. A lot of them bear some resemblance to the texts above and to each other, but I have not been able to determine any close relationships.

Verses: "Si quis nascatur dum Saturnus dominatur" (Walther 17938): Ml,152r; Pf,55v; Kh,221r. "Luna vetus veteres, iuvenes nova luna requirit" (not in Walther), Bs,4r-5r; Sg p.26.

Sign-books, with properties of signs and/or elections according to the place of the moon: Mj,12r; Kt,11v-12r; Oa,153r+; Ef,198v,200r; Md,84r; Pn,3r-11v(coupled to text of Albandinus, (e2) below); Bu,11ra-13ra(also with dietary rules); Bx,2r-7v,10r-18v (some of the text strongly resembling (d1) above); Sg p.31(might be an extract of (d1)); Kh,161r+.

Longer lists of elections according to the moon's place among the signs: Ma,11v; E2,71r; Pr,26r-27v; Pe,45v+, with canon 44r; Bv,18r. Short lists: D,25r-v; Pd,56v.

Elections according to age of moon: W,57r; Le,20r-21v; Bf,12v+. Rotae with prognostications, 30 days: D,23r-v; N,71v, the latter much as the birth-prognostications in Wistrand, *Lunariastudien* 1942,8. Cf. generally Svenberg 1963.

Planet-books: O5,234v-235r; Kh,163v+.

Tables of relationships between signs and planets, mostly showing houses, exaltations, etc., for each sign: Fp,1r-2r; Pr,22v-23r; Ba,149v; Mj,12v; Ew,42r; Le,17v (a rota); X,10v (figures).

Lesser notes, verses or tables on properties of planets or signs, sometimes with melothesy: Ca,148v; S,21v; X,9r; Pn,13r; Ml,151r; Ny,16r; Od,9v-10r and 52v (mentioning Albumasar, de revolutionibus); Bf,6v; Pc,58v; Pe,43r. See also above, (d5b).

Other rules: Kt,9v-10v.

(e) Rotae or tables used for calculation.

(e1) The Sphere of Pythagoras/Petosiris, a rota with 23 divisions for the letters, for judging on mortality of illness (cf. Thorndike, *Hist. of Magic. . . I*(1923)682-4), is in W,57r; Md,74v and 83v; So,53r; Wi,11r; Pn,12r-v. There are varying canons: W and So have the "pone feriam diei in qua infirmitas accidit. . .", and the same plus Md,74v have the verses "Collige per numerum quidquid cupis esse probandum. . . vita patet sursum, mors est signata deorsum"(T&K 234). Two similar rotae are at Md,83r(for finding sign of nativity); Wi,8v(?).

(e2) The "liber similitudinum omnium filiorum Adae fortunatorum" (Albandinus, from T&K 616), with a numbered alphabet for finding sign of nativity, is at Pd,56r and Pn,3r-11v; in the latter case it has been coupled to a sign-book, and the piece has been attributed to Albumasar.

Other alphabets, for nativities or mortality, are in Wi,8v-9r, and a list for calculating from the date alone, in So,57r.

(f) Various texts whose connexions have not been determined.

Temperaments: Wi,11v-14r; Pd,38v; L,9v; Bs,4r-5r; Bu,13r; O5,233v.

Phlebotomy: Bu,13r; Pd,58r; Sg,p.32 and 37-8. I have seen no figures of vein-men.

Month-rules, mainly on diet and in Calendar: "Escas per Ianum calidas est sumere sanum. . ." (Walther 5538): L,9r-v; Oc,38v-44r. Prose rules in W,61v+; Bs,6v+; Wu,2v+.

Rules on weather: Sx,1r-v; Bs,4v; both quite common. Also "Vincentii festo" (App.5(f1)), in Sc and P1.

Tractatus
instrumenti eclipsium
(*Eclipsorium*)

Front of main disc (*facies*), with *cursor*.
 Inserted: *novella lunae*.
 Scale numbers refer to the relevant paragraphs of the text.

Back of main disc (*dorsum*).

Inserted: *novella solis*.

The joining of the parts is shown on p.465. See also p.463.

§1. This text was earlier edited by me from manuscript F (F.S.Pedersen 1978). More detail on the points mentioned below can often be found in the notes to that edition. For other references see *Introduction* §3d. The present text follows manuscript N; numbers in parentheses refer to my paraphrasing of this text. A concordance with the earlier edition is in §8 below.

§2. Manuscripts.

N Napoli, Bibl.Nazionale, VII.A.26. Vellum, 24 × 16½, ff.1+258. Our treatise fills a separate part (243r-258v) from the 14th c. Provenance "S.Francisci Capistrani" (1r; Cenci). Some user has marked the tables (41-42) against the rows for 1289, thus dating his interests to 1312 or earlier.

Cenci, Manoscritti francescani I,1971,379-80 (description and summary of earlier registration). Kristeller I,403a. OP 7.2;8.2;9.3.

243ra-253vb (Hdg.): Incipit tractatus instrumenti eclipsium magistri Petri de Dacia. (:Txt, §1-112:) Prolixitatem quae quamplurimos. .ab alterutro nodorum [[Explicit.]] **254r-257v** (Tables (113-125).) **258r** (Additional tables (28a-31a,116a,118a-120a): see §6 of this Preface.)

Besides the hand of the text and rubrics (=N) there occur at least two hands, which are contemporary with N and may be by the same scribe:

(Na) the corrections of (54-55), and possibly of (58);

p. 15 (Nb) the corrections of (60); glosses on (1,2,37,38), see below; possibly the corrections to (25); models for the rubrics, generally written at the bottom of the pages; and annotations "bona" to most of the tables. – The glosses by Nb are as follows:

(1): Tractatus iste dividitur in 3 partes: in prooemiale, executivam, <compositionis rationis redditivam. Secunda in capitulo proximo, ibi *Exquisite* (2); tertia in capitulo ultimo, ibi *Expedito* (84). In prooemio (1) primo ponitur intentio in generali; secundo, ibi *Et quia instrumento* (1) ponitur ordo.

(2): *Exquisite*: pars executiva, in qua tria fiunt: primo enim <*> (incomplete).

(37, "De primo"): id est de tempore mediae coniunctionis vel oppositionis.

(37, "primum enim"): id est, subtrahas illud, quod invenitur in tabula communi de tempore mediae coniunctionis vel oppositionis, de illo, quod invenitur de tempore in tabula mediae coniunctionis, si sit de sole, vel de tempore in tabula mediae oppositionis, si sit de luna. *Et residuum per tertium extendas*: id est, addas residuo post subtractionem illud, quod invenitur de tempore in tabula tertia, id est in tabula mensium, in directo illius ad quem intrasti.

(38, "tempus Ianuario ascriptum"): <id est illu>d quod <stat> in directo Ianuarii de tempore.

(Letters lost in the photo and not supplied with confidence are in <>.)

A fragment is in

Bibl. Apostolica Vaticana, Reg.lat.1452. Vellum, ff.122, 28 × 20 except the last quire (ff.118-21), which is 26 × 18. 14th c. Earlier in Dominican house at Clairmont, donated by a *decanus* of the church of Cēbazat (Puy-de-Dôme; note at 121v, possibly still 14th c.).

Eneström (1885,3)21, and (1885,8)66-7 disbelieving in the existence of another manuscript recorded by Montfaucon. Leonardi, *Aevum* 34(1960) 468-9 no.207 (on owner's note). Kristeller II,402. OP 2.3;2.4.

?115r-121v (Astrology, in at least two hands of the 14th c., including extracts from Haly's commentary on Ptolemy's Centiloquium. The text leaves off at 117v and is resumed at 119v, after the tables to be mentioned.)

118r-119r (with independent pagination "6-8": table like (113). Heading, in a hand unlike those just above:) Tabula magistri Petri Philomenae de

Dacia ad inveniendum propositionem(!) cuiuslibet numeri secundum propositionem cuiuslibet alterius ad 30 vel 60. Et deservit prima columna utriusque(!) minoribus 31, secunda alteri minori et alteri maiori, tertia vero utrisque maioribus. **119v** (list of five eclipses, 1309-1312, in same hand as table preceding: I give a straightforward transcription of the figures, without keeping the lay-out. The time-columns are headed "anni perfecti a Martio", "menses a Martio", etc.):

			Pcta. diam.	Pcta. superf.	Tota eclip.	Ini- tium ecl.	Finis eclip.	
1309	5 ^{me} 21 ^d	9h; 2	30	0	3h;30	7h;17	10h;47	oppositio
1309	10	30 23; 0	10	40	2 ; 0	22 ; 0	24 ; 0	oppositio
1312	8 14	4;27	9	0	2 ; 6	3 ;24	5 ;30	oppositio
1312	3 18	8; 5	10	20	2 ;56	6 ;37	9 ;33	oppositio
1312	4 5	20;51	5	40	1 ;40	20 ; 1	21 ;41	coniunctio

On the basis of the format and pagination of the quire f.118+, one would like to think that it formed part of an unfinished manuscript of the Eclipsorium, and was detached and re-used for the present purpose.

§3. Authorship, place and date.

The passages of F quoted above yield the full name of the author and serve to connect him with the town of Roskilde (OP p.34). By the same token he may have known the round value of 30°E for the longitude of Roskilde, implied by the Liber Daticus (*Introduction* §18a), supposing that he used the value 23°;45 for the longitude of Paris (*ibid.*).

The treatise itself was meant for use in Paris and was no doubt composed there (OP, *l.c.*). Indeed, (58) and the tables (41-42) mention Paris, and the tables probably use the parameters of William of St.Cloud's *Almanach* from 1292 (*Intr.* §21). I do not understand the statement of the first version of N in (58).

A *terminus post* for the texts in N and F would seem to be the precession values 10°¹/₃, resp. 10°;22, of (58), surely deriving from William's *Almanach*, which has these values for the years 1297 and 1300. Thus, even allowing for the possibility that the values were taken to be 2' lower than intended by William (cf. *Intr.* §11a), one may feel safe in dating the treatise to about A.D.1300 or not much later. It is later than 1292, the date of the *Almanach*, and later than the Calendar, since it uses parameters more recently determined; but the Calendar itself has not been dated with any precision (*Intr.* §8).

§4. *Remarks on the text printed.*

The text (including the headings to the chapters and tables) follows N. I have used F only to correct what looked like obvious errors. The signs < > for insertion and [] for deletion, by the editor against N, are used only occasionally. Italics are used for everything except the text-hand, such as rubrics, marginals, etc. Where numbers could be re-calculated (for details see F.S.Pedersen 1978) I have generally adopted the majority of N, F, and the re-calculated value, ignoring what might be round-off errors.

The apparatus is intended to record all departures from the wording and numbers of N, except for: paragraphing, punctuation and orthography, which are by the editor; ordinal numbers, which have been spelled out; banal dittographies and misplaced zeros in the table-headings, which were ignored; and running corrections to the tables, which were adopted. F is only adduced occasionally, and the longer passages from F are only quoted to illustrate some point emerging in this Preface.

The diagrams, drawn from the description in N, follow (3),(7), and (91) in taking *supra* to mean "farther from the centre than. . .", etc., contrary to the *Quadrans vetus*. In drawing I have supposed the node plus the cursor to stay in their topmost positions, and interpreted the left/right directions accordingly. In (4), however, the signs for "11 et 5 signa" should be to the right. - On the cursor (7-10), as in the Quadrant, the most finely-divided zone of each scale is outermost, whereas elsewhere, at least in (3),(4), and (14), the opposite is the case, as it seems to be in all scales of F. I have kept this apparent inconcinnity.

§5. *Remarks on the versions of N and F.*

The versions differ so much that it is impossible to work them into one edition in their entirety. As for N, its tables happen to be much less erroneous than those of F. This may partly be due to revision: indeed, the error in (42) against F seems introduced by a mechanical check against (41); and in (28) an extra entry has been added in an attempt to smoothe out a mis-reading. The latter error has then been taken up by the text of N (19), which may, then, have been gone over on the same occasion or later. This may explain why N looks more

polished idiomatically than does F, and why N omits the specific references to the author's home and surname (cf. §3 above). One feature of N which may be an innovation is the (correct) introduction of two kinds of *minuta proportionalia* by the correction of Na in (54), which leaves traces in (60)(version of Nb) and in (73,75,82)(text-hand). This, of course, is most easily explicable when assuming that all the hands are by one scribe who was also the reviser in this respect. The distinction of the *minuta* seems to be neglected in (56) and (62), which, together with the close of (65), are the passages using the *tabula erroris tollendi*, absent in F: this, then, may be original or at least earlier than Na/Nb and overlooked in that revision.

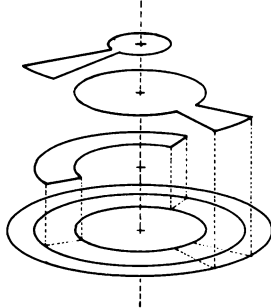

On the other hand, in matters of construction of the instrument and use of the tables, F seems to be the one to seek for simplicity, even at the cost of substituting wrong parameters for correct ones, as detailed in §6. F also seems to have improved upon N's version once or twice, notably at (80) (the placement of the *fiducia*, cf. the explanation of F after (111)), and before (81) where a test is provided for discontinuing calculation.

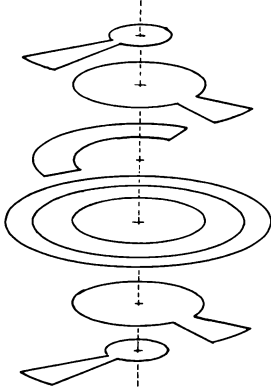

On the whole, then, it may be safest to assume that both F and N are revisions of some original, but that the corrections of N mainly concern the details of the text and tables, whereas F has revised the procedure thoroughly without unnecessarily altering the details of the wording.

§6. *The instruments and tables of N and F.*

Besides the *novella solis* and *novella lunae*, F has another set of similar pointers named *novella maior/minor*. These are always fixed to the back of the instrument, and the former always to the front. When inscribing the scales of the instrument, N, like the *Quadrans vetus*, uses a ruler through the centre, whereas F uses the *fiduciae*, having prepared and mounted the *novellae* as early as necessary.

In the summary descriptions of scales and tables given below, "Scale 6" or just "6" refers to the scale described in (6), and analogously for tables. Some linear scales will be characterized by "(greatest value read on scale → extension measured on Scales 4 or 18)", where a "±" means that the figures are valid for either part of a scale made up of two symmetrical halves. Tables of magnitudes or durations may be labelled as either (**L**) look-up tables, where

INSTRUMENT OF N (=edition):		SCALES:
novella lunae		-
novella solis		13-16
cursor		8-10
main disc (limb)		front: 4-6 back : 18-22

INSTRUMENT OF F:		SCALES:
novella lunae		-
novella solis		*,16
cursor		8-10
main disc		front: 4-6 back : 18,19,21; *,14,15
novella maior		13
novella minor		-
		(*: elongation)

the independent variable is entered in round values and mostly at equal intervals, or as **(I)** scale-inscribing tables, with round values of the dependent variable. Scales or tables of durations may use either of two sets of values for angular velocities at apogee/perigee, labelled **(A)** 30';18/36';4 per hour, for phenomena near the true syzygy such as obscuration and parallax; and **(B)** 30';12/36';10 per hour, presupposing an elongation of 7° and supposed to be adequate for finding the interval between the mean and true syzygies; cf. (95-6) of the text, and Toomer 1968 no.56-7.

The following scales or tables are essentially the same in F as in N: 41-44 (tables of mean motions, F showing the range A.D.1073-1601); 113-115, 121-122 (general); 8-10, 26-27 (scales on cursor, and tables for inscribing them).

The *scales for argument of latitude* (4 and 18) are shorter in F than in N, corresponding to a change in Scale 13, cf. (85) and (75). Thus,

	N	F
4 argum.lat.	front, limb ($\rightarrow 28^\circ$)	front, limb ($\rightarrow 24^\circ$)
18 argum.lat.	back, limb ($\rightarrow 28^\circ$)	back, limb ($\rightarrow 24^\circ$)
13 div.asp.lat.	nov. solis ($\pm 70' \rightarrow \pm 13^\circ; 25$)	nov. maior ($\pm 60' \rightarrow \pm 11^\circ; 30$)

Scales and tables for magnitudes and for durations. All but one of the tables here recorded occur in two versions in N. The alternative versions appear as additional tables at the end of N or, in one case, in the form of corrections to the first version; they are all scale-inscribing tables, also in the cases (116a, 118a-120a) where the texts of both F and N provide for look-up tables rather than scales. The (A)-values of the angular velocity are appropriate for computing durations and are in fact those used for the first versions in N.

Magnitudes:

	N	F	N,additional
5 pc.lun.	front, limb	(as in N)	
24 tab.pc.lun.insc.	I	(construction, approximating N)	(none)
19 pc.sol.	back, limb	(as in N)	
28 tab.pc.sol.insc.	I (with error against F)	(construction, approximating N)	I (as N, reversed)
20 diff.pc.sol.	back, limb	(omitted)	
29 tab.diff.pc.sol.	I	(omitted)	I (as N, shorter, reversed)
118 tab.diff.pc.lun.	L	L (as N)	I

Durations:

6 dur.lun.	front, limb	(as in N)	
25 tab.dur.lun.insc.	I(A), corr. to I(B)	I(B) (as Np.c.)	
21 dur.sol.	back, limb	(as in N)	
30 tab.dur.sol.	I(A)	I(A) (as N, shorter, reversed)	I(A) (as F)
22 diff.dur.sol.	back, limb	(omitted)	
31 tab.diff.dur.sol.	I(A)	(omitted)	I(A) (as N, shorter, reversed)
119 tab.diff.dur.lun.	L(A)	L(A) (as N)	I(A)
120 tab.morae	L(A)	L(A) (as N)	I(B)
116 tab.diff.morae	L(A)	L(A) (as N)	I(B)

Notes: Table 119 shows no alternative to the (A)-values, and since it was probably calculated alongside with Table 25 originally, the

inappropriate use of the (B)-values in the alternative version of Table 25 must be taken as secondary. Of the *additional tables in N*, 116a and 120a use the (B)-values inappropriately, against both F and the first versions in N, and are thus likely to be secondary (cf. §7); they may be the result of a plan for extending the instrument with more scales, known and rejected by N (104). N has room for *Scales 20 and 22*, cf. (86) "addendo ibi quaedam ne vacarent loca". F has no room, and also leaves out any tables to be used instead of the scales; correspondingly, instead of the first half of (82), F has a short text with the instruction "aeques sicut supra in eclipsi lunari", where scales were used.

Scales 14 and 15, using the velocities (B) to determine the time elapsing between the mean and true syzygies, are on N's *novella solis* and designed to be entered with $13/12$ of the elongation, cf. (49) and (93-6). For the same purpose N provides Table 125 in case Scale 14 is too short to be accurate (83). F, on the other hand, manages to extend Scales 14-15 by placing them on the *dorsum* ("tempus enim huius longitudinis commodius in dorso ordinavi" F, instead of (95-6)) covering the whole circumference, and by adding a reference scale co-extensive with them and measuring 7° , thus intending the scales to be entered with the elongation alone. Then F also uses the scales for determining the time elapsing for a given parallax in longitude, whereas N provides a table (123) using the proper velocities (A) for this. Thus the distribution

		<i>N</i>	<i>F</i>
14	temp.long.	nov.solis (B)($\pm 15^h;4 \rightarrow \pm 7^\circ;35$)	back (B)($15^h;4 \rightarrow 7^\circ$)
15	diff.temp.long.	nov.solis (B)($\pm 2^h;29 \rightarrow \pm 7^\circ;35$)	back (B)($2^h;29 \rightarrow 7^\circ$)
--	longitudo	(none)	back (7°)
125	tab.temp.i. 2 opp/conj.	L(B)	(none)
123	tab.temp.asp.+duodec.	L(A)	(none)

Here again F seems to be the innovator, having partly forgotten the distinction between the values (A) and (B).

Both N and F have *Scale 16* on the *novella solis*, for the twelfth of the elongation in a mean syzygy. F has a parallel scale for the elongation itself, and uses it with Scale 16 for taking the twelfths both of the elongation (cf. (47)) and of the parallax. N uses Table 124 in the latter case (79). Thus,

		<i>N</i>	<i>F</i>
16	duodec.longit.	nov.solis ($\pm 35' \rightarrow \pm ca. 6^\circ; 58$)	nov.solis ($\pm 35' \rightarrow \pm 7^\circ$)
--	longitudo	(none)	nov.solis ($\pm 7^\circ \rightarrow \pm 7^\circ$)
124	tab.duodec.cuiusl.num.	L	(none)

Finally, N has the *tabula erroris tollendi* (117), missing in F.

§7. Note on sources.

No sources are cited in the text. The following is a sample of parallels from texts which can be supposed to have been within easy reach of our author.

The contents of the preamble (1) has counterparts in several contemporary preambles to treatises on instruments or tables, such as Campanus' *Theorica Planetarum* (Benjamin & Toomer 1971), the Quadrant treatise by Profatius Iudaeus from 1301 (Boffito & Melzi D'Eril 1922,25), and later on, Jo. de Lineriis' "Multiplices philosophiae" (T&K 889; ms. Par.lat.7281,201v-202r). The similarity to the preamble of the *Semissa* treatise was pointed out by O.Pedersen (1976,49).

The descriptions of the limb and cursor (2,7,9), and the terminology used in the construction generally, are probably modelled on the *Quadrans vetus* "Geometriae" (ed. Tannery 1922, 118 ff.): for instance, as concerns the *cursor* and its "zodiac"-scale, our (7-8) may be compared to §11-13 of the Quadrant treatise. The device of two pointers named *novella solis/lunae* is not elsewhere in evidence before Profatius Iudaeus' second version of the *Quadrans novus*, from 1301 (*Intr.* §12a; Poulle 1964,I,161;II,184,187). This seems to speak in favour of a latish dating of our treatise, cf. §3.

Instructions for using tables can be found in (32-6)(mean syzygies) and (70-7)(parallaxes). In both cases, quite close parallels in wording are offered by the *canones Azarchelis* "Quoniam cuiusque", accompanying the Toledan Tables (Toomer 1968). As concerns the instructions on mean syzygies, closer parallels might be supposed to occur among canons to tables which, like those of our treatise, are based on the Christian calendar rather than the Arabic one. Such tables were the Toulouse Tables for planetary mean motions, which were then current in Paris alongside with the Toledan ones, and were utilized in

the *Semissa* (cf. *Intr.* §21, and below). That treatise does not, however, furnish canons for tables of mean syzygies, and I do not know of any other canons to the Toulouse Tables. Canons to other tables using Christian year-reckoning occurred later on, such as those of Jo. de Lineriis "Cuiuslibet arcus"/"Priores astrologi", for the Alfonsine Tables. These canons offer parallels for the terms "radix anni" (34) and "argumentum latitudinis primo aequatum" ((50), etc.), which were no doubt current in the period: an instance of the latter is found in a contemporary gloss to the tables of William of St. Cloud's *Almanach* in the manuscript Vat.lat.3572,1r. As for the parallax calculations, our text differs from the *Canones Azarchelis* at some points of procedure which were in any case debated in the time, notably in using the table of *minuta proportionalia* with a maximum of 60° instead of the correct one with a maximum of 12° ((73); this kind of mistake is censured by John of Sicily); and in making the parallax in longitude change its sign at the meridian, not at the point of the ecliptic 90° from the horizon ((79,110); both methods are reported by John of Sicily indiscriminately, though the latter had been pointed out as correct e.g. in Albattani ch.39). A comparison with the *Semissa* in these respects can be found in *Intr.* §14.

The determinations of true conjunctions (45-48) and of magnitudes and durations (59-66,80-2) are mainly done by means of the instrument, and the procedures are those commonly used, in the *Canones Azarchelis* and elsewhere.

Some stray parallels to the argumentative chapter (84-112) can be found in John of Sicily, notably to (101), in N only, and to (111-12). The passage of F after (111) might be an after-thought based on the *Canones Azarchelis* (e.g. Par.lat.7406,16ra).

We are on surer ground as concerns the tables. The mean conjunction tables (41-43) resemble the Toulouse Tables in using 24-year intervals. The years themselves are, however, different, and consequently (43) has been revised to take account of the altered position of the leap-years. The parameters used were probably those from the *Almanach* of William of St. Cloud (*Intr.* §21). The tables of magnitudes and durations (24-5,28-31,116,118-20; see §6 above) are based on the Toledan Tables (Toomer 1968 no.58,60,cf.56-7); it may be here noted that the tables of durations in lunar eclipses (116,119,120, in N and F) rest on a mis-reading of the Toledan Tables, namely, the value

12°;47 of the *dimidium morae* for an argument of 3°;30 and the moon in the apogee, whereas the analogous tables (116a) and (120a), appended to N, presuppose the correct reading of 13°;47. (The table (25) does not use the value.) – Except for (117), which I have not been able to identify, and for (123-5), which are banal, the rest of the tables are identical to, or simple transforms of, the Toledan/Toulouse Tables. Thus, (26) corresponds to Toomer 1968 no.37; (27) to 39; (114) to 80; (115) to 17; (121) to 26; (122) to 72.

Tables of proportions like (113) were known at the time: at least, a triangular "tabula de minutis proportionalibus" is found in the 13th-century collection of Toulouse Tables Par.lat.16658(66r-69v). Later on, a canon resembling (53) is found in the "Cuiuslibet arcus" of Jo. de Lineriis (ms. Par.lat.7286C,27r; Vat.Pal.lat.1412,49v), whether copied from our treatise or from some common source.

On the whole, the *Eclipsorium* is well accounted for by sources current in Paris about the year 1300, and may itself have been used by Jo. de Lineriis. Finding more sources appears to be a project by itself.

§8. Conspectus of paragraph-numbering in this edition compared to the edition of F (F.S.Pedersen 1976). Some small variations in paragraph-limits are ignored.

(1) *Incipit tractatus instrumenti eclipsium magistri Petri de Dacia.* Prolixitatem quae quamplurimos in projectione eclipsium laborantes, citra finem affectos taedio, ab amore artis retrahit, intendens praescindere; formidinem quoque quae nonnullos, labore prorsus indefesos, in pronuntiatione earundem praeoccupat, praeccludere; quomodolibet modum novum in utraque eclipsi investigandi necessaria, multiplicatione et divisione exclusis penitus, succincte faciliter et sensu palpandum plurimum propono tradere, qui inspiravit altissimo aspirante. Et quia instrumento plerumque uti oporteat, eius compositio praemittatur.

(2) *Adaptatio materiae instrumenti et inscriptio argumenti latitudinis.* Exquisite igitur complanetur tabula et ad formam circuli redigatur. Fiatque in ea circulus ad sextam partem semidiametri vel circiter a limbo, et dividatur spatium quasi in duo aequalia per circulum; et ad aequalitatem minoris sumatur de maiori, et fiat circulus iuxta alium, ut sint in medio duo circuli distinctionis gratia, duo aequalia spatia superius et inferius cum limbo et primo circulo continentes; quorum spatiorum utrumque in tria inaequalia dividatur, sic ut utriusque quod infimum sit minimum et maximum quod supremum. (3) Deinde circulus centro vicinior per 28 aequalia dividatur, positaque in centro regula protrahantur lineae a punctis divisionum per tria spatia inferiora; una autem, quam volueris, ad limbum per omnia protrahatur, quae vocetur intersectio sive nodus; (4) a quo hinc inde argumentum latitudinis lunae ad metas eclipsium inscribatur isto modo: Sinistrorsum enim a nodo in 13 spatiis superioribus ponantur 13 gradus argumenti, ab uno iuxta nodum inchoando; dextrorsum autem ponantur in primo spatio superiori 0 et 6, in secundo 29, in tertio 28, et deinceps ad 18 minuendo; in spatiis autem duobus, quae inter huius 18 et 13 alterius lateris relicta sunt, scribantur 11 et 5

1 incipit--Dacia: prooemium in tractatum eclipsorii petri daci F 3 praescindere: F; praecindere N 18 inaequalia: aeq. Na.c.

30 signa in sinistro, in dextro vero tituli inscriptionum. Et erunt inscripta signa et gradus argumenti latitudinis lunae, quibus subscribantur minuta, singula vel bina vel alias secundum capacitatem materiae, et minorum numeri, qui in utroque latere crescant sinistrorsum.

(5) *Inscriptio punctorum eclipsis lunaris.* Tria autem spatia superiora
35 dividantur isto modo: In centro enim posita regula, per 25. minutum argumenti (4) sinistrorsum a nodo ducatur linea, omnia tria superiora spatia occupando; sicque fiat ad 56. minutum, et consequenter, ut in tabula (24) punctorum eclipsis lunaris inscribendorum continetur; eruntque 21 spatia, in quorum ultimo scribatur 1, in paenultimo 2, et
40 deinceps usque 20, ut spatium primum vacet. Erunt igitur haec 20 puncta eclipsis lunaris ad augem epicycli, quibus subscribantur minuta singula et eorum numeri, qui crescant versus nodum. Vacanti autem spatio 46 minuta tantummodo subscribantur.

(6) *Inscriptio dimidii durationis eclipsis lunaris.* Reliqua vero pars, quae
45 est in dextro latere, iuxta tabulam (25) dimidii durationis eclipsis lunaris inscribatur. <In> inscriptione autem minorum singulorum servetur eadem proportio inter duo singula, quae est inter 5 et 5 vel decem et decem. Et erit inscriptum dimidium durationis eclipsis, ea condicione, ut sit luna in sua longitudine longiori, quae est aux
50 epicycli.

Et potes hanc partem, cui haec 3 inscripta sunt, vocare limbum.

(7) *Adaptatio cursoris.* Ut autem inscribantur reliqua, fiat circulus a limbo nunc inscripto distans ad quartam partem semidiametri totalis instrumenti; et quod inter hunc circulum et limbum fuerit, evacuetur,
55 ut in eo quaedam tabula moveri possit, quae habeat in longitudine 10 gradus et 2 minuta argumenti latitudinis nunc inscripti. Latitudo vero eius in 5 aequalia dividatur, et quodlibet eorum in tria inaequalia, ut sit semper quod supremum minimum et maximum versus centrum. Longitudo autem aequaliter dividatur per rectam
60 lineam, quae occupet tria spatia proxima limbo et sex proxima centro, sex intermediis omnino intactis; et erit haec linea diameter epicycli lunae et deferentis solis, ad auges amborum circulorum terminata.

(8) *Inscriptio arcus aequationum.* Situetur igitur haec tabula, sic ut
 65 dicta linea media principium alicuius gradus limbi attingat, et
 dividantur hinc inde tria suprema spatia secundum divisionem
 graduum limbi, ut sint ex utraque parte 5 gradus et unum minutum;
 et sic erit inscriptus arcus zodiaci, a quo epicyclus lunae comprehen-
 ditur, et in quo omnes aequationes solis et lunae cadunt, unde et
 70 vocetur arcus aequationum.

(9) *Inscriptio deferentis solis.* Post hunc arcum zodiaci sic inscribas:
 Numerentur enim in dicto arcu aequationum 4 minuta in dexteram a
 linea media, et ibi fiat signum; sicque fiat ad 24 minuta, et conse-
 quenter, ut in tabula (26) zodiaci inscribendi continetur. Et a signis
 75 ducantur lineae, sic quod in complemento signi ducatur linea per tria
 spatia arcui aequationum proxima, aliae autem per duo solum.
 Cum etiam ad unum gradum et 59 minuta, quae sunt maxima solis
 aequatio, factum fuerit, cum aliis divisionibus per alia tria spatia
 inferius ad sinistram recuratur, usque dum iterum pro uno gradu et
 80 59 minutis signetur: tunc enim est per prima spatia superius ad
 lineam mediam redeundum. Quo facto scribantur signa inferius, et
 singuli gradus et eorum numeri superius, proviso quod signum
 tertium ponatur ad medium superioris medietatis; crescant etiam
 numeri graduum secundum ordinem signorum; eritque hoc modo
 85 inscriptus zodiacus sive deferens solis.

(10) *Inscriptio epicycli lunae.* Hoc autem modo epicyclus lunae in sex
 inferioribus spatiis inscribatur: Numerentur in eodem arcu aequatio-
 num 24 minuta a linea media similiter in dextram, et ibi signetur, et
 ad 48 minuta et consequenter, sicut in tabula (27) epicycli lunae
 90 inscribendi continetur. Ducantur etiam sicut prius in complementis
 signorum lineae divisionum per 3 spatia, lineam mediam statuendo
 initium primi signi in medietate superiori. Fiant autem alia omnia hic
 ut in inscriptione zodiaci (9), nisi quod hic ad 5 gradus et unum
 minutum fiat reditio per 3 inferiora spatia ad lineam mediam in
 95 complemento tabulae, quam iterum a capite incipias, partem si-
 nistram epicycli sicut dexteram inscribendo.

(11) Et erit epicyclus lunae inscriptus, et tota tabula consequenter.
 Vocetur quoque haec tabula cursor: curret enim, sed cum difficul-
 tate quadam, in spatio sibi adaptato.

100 **(12)** *Adaptatio novellae solis.* Inscriptis limbo et cursore, fiat novella magna, cuius caput cursorem contingat secundum circulum; rostrum autem eius cum limbo terminetur. Habeat etiam hoc rostrum in latitudine 70 minuta de arcu aequationum, comprehensum duabus lineis a centro capitis ductis, quae vocentur duae fiduciae novellae
105 solis, dextra et sinistra.

(13) *Inscriptio diversitatis aspectus lunae in latitudine.* Locetur quoque centrum capitis huius novellae ad centrum instrumenti, sic ut caput novellae supra centrum instrumenti moveri possit; positaque alterutra fiduciarum in principio alicuius gradus limbi, numerentur in
110 partem novellae 13 gradus et 25 minuta, ubi, posita regula, ducatur linea a limbo capitis versus centrum; eritque haec linea aequedistans ab utraque fiduciarum. Quo facto fiat circulus a limbo capitis <distans> secundum quantitatem quae competere possit inscriptioni minutorum singulorum cum numeris eorundem. Unde iuxta hoc,
115 spatium istud secundum latitudinem in duo inaequalia dividatur; longitudo vero eius ab alterutra novellarum ad lineam mediam in 14 aequalia dividatur, et posita regula supra centrum, protrahantur lineae divisionum per ambo spatia. Item pars quaelibet in 5 dividatur, et protrahantur lineae divisionum minus spatium occu-
120 pando; et erunt 70 minuta, quibus sui numeri ascribantur, qui initium habeant a novella. Sicut autem dividitur unum latus, sic et reliquum; et erit inscriptus circulus diversitatis aspectus lunae in latitudine.

(14) *Inscriptio temporis longitudinis et duodecimae.* Ordine hoc his expeditis, numerentur ab utraque fiduciarum hinc inde 39 minuta et 34
125 secunda in circulo diversitatis aspectus (13), et utrobique posita regula, ducantur duae lineae versus centrum, inter quas ducatur linea circularis, aequedistans circulo aspectus secundum quantitatem quae solet inscriptioni graduum et minutorum singulorum cum suis
130 numeris assignari; et secundum hoc dividatur spatium in 3 inaequalia in latitudine. In longitudine vero utrimque a fiduciis per 15 aequalia fiat divisio, dimisso secundum aestimationem in ambabus extremitatibus spatio pro quintadecima parte unius; et hinc inde in aliis 15 spatiis scribantur superius 15 horae, a fiduciis inchoando, et

110 novellae: fiduciae F 114 cum numeris: et numerus N; cum suis numeris F
115 inaequalia: aequalia Na.c.

135 sub eis minuta singula et numeri minorum; et erit inscriptum
tempus maximae longitudinis et suae duodecimae inter solem et
lunam, vel eius nadair, cum secundum medios motus coniunguntur.

(15) Sed quia hoc tempus supponit lunam esse in auge epicycli,
ducatur iterum linea aequedistans prioribus ad quantitatem quae ut
140 prius solet inscriptioni graduum et minorum cum suis numeris
assignari; et iuxta hoc, spatium secundum latitudinem in 3 inaequalia
dividatur, secundum longitudinem vero in hunc modum: Numerentur
enim ab utraque fiducia hinc inde 12 horae et 8 minuta de horis
longitudinis (14), et utrobique posita regula, ducantur lineae per
145 omnia 3 spatia. Deinde longitudo utrimque ad fiducias in duo aequalia
dividatur, et ut prius omnia tria spatia occupentur; et erunt utrimque
3 spatia, in quorum primis a fiduciis scribatur 1 et in secundis 2;
ultima autem vacent, quibus 29 minuta singulis subscribantur; aliis
autem singulis sua minuta cum minorum numeris integraliter
150 deputentur. Et erunt hinc inde duae horae et 29 minuta, quae sunt
differentia temporis maximae longitudinis et suae duodecimae, luna
in auge existente, ad tempus eiusdem longitudinis, ipsa in opposito
augis existente.

(16) *Inscriptio duodecimae longitudinis.* Modus autem inscribendi
155 duodecimam longitudinis sit iste: Ducatur linea aequedistanter infimae
iam factarum, secundum quantitatem convenientem inscriptioni
minorum cum suis numeris; et dividatur spatium iuxta hoc in duo
inaequalia secundum latitudinem, secundum longitudinem vero sic:
Numerentur enim utrimque a fiduciis 2 horae et 17 minuta cum
160 dimidio de tempore differentiae nunc inscripto (15), et utrobique
posita regula, ducantur lineae per ambo spatia. Deinde longitudo
utrimque ad fiducias in 7 aequalia dividatur, et protrahantur lineae
divisionum per ambo spatia; dividatur quoque quodlibet spatiorum
in 5, et protrahantur lineae divisionum per minus spatium, ut sint 35,
165 quae sunt minuta duodecimae maximae longitudinis inter solem et
lunam, vel eius nadair, secundum medios motus coniunctos; quibus
ascribas suos numeros, qui initium habeant a fiduciis, dextrorsum
eundo et sinistrorsum.

(17) Et erit inscripta novella magna, quae vocetur novella solis, cui
170 adiungatur quaedam alia cuiuscumque magnitudinis; coextendatur
autem alteri in longitudine, et habeat duas fiducias sicut et alia; quae
vocetur novella lunae. Et erit completa pars prima, quae vocetur
facies instrumenti.

(18) *Inscriptio dorsi instrumenti.* Expleta facie, fiat in dorso limbus, et
175 dividatur in latitudine consimiliter sicut limbus faciei; secundum
longitudinem etiam dividantur tria inferiora spatia sicut ibi (4), et
inscribatur argumentum latitudinis consimiliter, proviso quod nodus
huius limbi sit contra nodum alterius.

(19) Deinde numerentur sinistrorsum a nodo 13 minuta argu-
180 menti, et ibi et in centro posita regula, ducatur linea per omnia tria
spatia superiora; sicque fiat ad 48 minuta, et deinceps secundum
tabulam (28) punctorum eclipsis solaris inscribendorum. Et erunt
12 spatia, in quorum [primo iuxta] ultimo ponatur 1, in paenultimo
2, et deinceps ad 11, ut primum vacet, cui 45 minuta subscribantur,
185 aliis autem singulis 60 et eorum numeri sicut supra; et erunt inscripta
puncta et minuta punctorum eclipsis solaris, ea ut supra condicione,
ut sit luna in sua longitudine longiori.

(20) Secundo enim sinistrorsum etiam a nadair nodi numeres 30
minuta, et ibi et in centro posita regula, ducatur linea per duo spatia
190 minora trium superiorum; sicque fiat ad unum gradum, et conse-
quenter secundum tabulam (29) differentiae duarum longitudinum in
punctis eclipsis solaris; et erunt 19 spatia, quae secundum nunc
dictam tabulam inscribantur; et erunt 59 minuta unius puncti,
secundum quae plus eclipsari contingit de diametro solis, in longitu-
195 dine propiori luna existente, quam ipsa existente in longitudine
longiori: unde et placuit vocare ipsum differentiam duarum longitu-
dinum in punctis.

(21) Hoc facto eatur ad nodum iterum, et ab eo dextrorsum
numerentur 39 minuta, ibique et in centro posita regula, ducatur
200 linea per duo minora spatia trium superiorum; sicque fiat ad unum
gradum et 18 minuta, et deinceps secundum tabulam (30) dimidii
durationis eclipsis solaris, proviso quod in complemento horae
omnia 3 spatia occupentur; et erunt 19 spatia in longitudine, quae

179 13 minuta: N ex §28; om. F recte 183-4 12. . . 11: N ex §28; 11. . . 10 F recte

184 et deinceps: ut d. N 201 gradum: ins. N (=Nb?)

secundum dictam tabulam inscribantur; et erit dimidium durationis
 205 eclipsis solaris inscriptum, ea similiter condicione, ut sit luna in sua
 longitudine longiori.

(22) Ob hoc igitur dextrorsum a nadair nodi signes unum gradum,
 et occupentur duo minora spatia trium superiorum; sicque fiat ad 2
 gradus et 7 minuta, et deinceps iuxta tabulam (31) differentiae
 210 duarum longitudinum in dimidio durationis eclipsis solaris; et erunt
 13 spatia, quae secundum nunc dictam tabulam inscribantur. Et
 erunt inscripta minuta temporis, in quo dimidium durationis eclipsis
 solaris maius esse contingit ad longitudinem longiorem; et ideo
 vocatum est et istud differentia duarum longitudinum in dimidio
 215 durationis eclipsis solaris.

Et haec de inscriptione dorsi sufficiant.

(23) *Modus connectendi partes instrumenti.* Nunc vero perforetur instru-
 mentum ad centrum, sic ut clavis notabilis quantitatis intrare possit,
 qui ambas novellas contineat ad instrumentum per cuneum, qui per
 220 clavum transeat, sic ut novellae nunc in facie, nunc in dorso, ut opus
 fuerit, poni possint. Demum fiat foramen per utrumque nodorum, ut
 in eo axis armillae moveatur, per quam aptius portetur instru-
 mentum.

Et completa sit in hoc compositio instrumenti, quod vocetur <*>.

- 225 **(32)** *Investigatio eorum ex quibus de eclipsi arguitur.* Ad investigandum igitur ea, [ex] quibus ut suppositionibus utendum est, et ex quibus eclipsis cuiuscumque necessitas vel impossibilitas arguitur, sic procedas: Si enim in quocumque mense anni cuiuscumque, an eclipsis futura sit, volueris investigare, cum annis domini, annumerato eo de
 230 quo intenderis, tabulam coniunctionis (41) si de eclipsi solis proposueris, vel oppositionis (42) si de eclipsi lunae, intres, et quod de ultimo titulo edirecto fuerit, extra scribas. **(33)** Quod si nihil fuerit in signis et minus 12 in gradibus, vel 5 in signis et plus 18 in gradibus usque ad 6 signa, erit eclipsis solis possibilis circa principium illius
 235 anni, si tabulam coniunctionis intrasti. Si autem tabulam oppositionis intrans inveneris de eodem ultimo titulo 0 vel 6 in signis et minus 12 in gradibus, aut 5 vel 11 in signis et plus 18 in gradibus, erit eclipsis lunae possibilis circa principium eiusdem anni. **(34)** Quod si annos intentos non inveneris in tabula, tunc pauciores,
 240 propinquiores tamen, quaeras; et quod edirecto eorum fuerit de eodem ultimo titulo, extra scribas. Deinde cum eisdem annis omnibus intentis tabulam (43) communem coniunctioni et oppositioni intres, et quod edirecto eorum fuerit de eodem ultimo titulo, alteri prius extracto subscribas et eidem aggregates, eo modo qui in
 245 collectione mediorum motuum planetarum observatur; et aggregatum si in aliquo dictorum casuum fuerit, erit eclipsis illius luminaris possibilis, de quo intendisti, circa principium anni ut prius. Et hoc, quo circa principium anni indicatur eclipsis possibilis, dicitur radix anni.
- 250 **(35)** Si etiam, utrum in quocumque mense anni eiusdem sit eiusdem luminaris eclipsis possibilis, scire volueris, tabulam (44) mensium intrans, quod edirecto cuiuslibet mensis fuerit, etiam de ultimo titulo, radici anni seorsum aggregates; et <si> ex cuiuscumque ad radicem anni aggregatione aliquis dictorum casuum provenerit, erit
 255 illius luminaris eclipsis possibilis circa illum mensem, ex edirecto cuius sumpto, et radice anni, casus provenit.

(36) Et cum aliquem dictorum casuum inveneris, intres secundo eandem vel easdem tabulas, et eodem vel eisdem locis; et quod edirecto ex tribus primis titulis fuerit, eo ordine qui est in tabula

260 extra scribas, quodlibet sub alio sui generis collocando; duoque
ultima eodem modo aggreges, sicut de eo iam dictum est quod ad
ultimum titulum extraxisti.

(37) De primo autem alia ratio est: primum enim per secundum
minuas, et residuum per tertium extendas, et quod provenerit, a
265 principio mensis introitus numeres; et ubi dies fractionum ceciderit,
erit coniunctio vel oppositio, si annus sit communis; si autem bis-
sextilis, erit procul dubio in die praecedente. (38) Si autem secun-
dum a primo non possit subtrahi, tertium primo superaddas et ab
aggregato secundum minuas, et residuum a principio mensis in-
270 troitus numeres, et cetera sicut prius. Si etiam a primo et tertio simul
iunctis aut a primo, non existente tertio, secundum non possit
subtrahi: ei, quod minus est, tempus Ianuario ascriptum superaddas,
factaque subtractione residuum de diebus kalendaribus mensis praec-
cedentis mensem introitus minuas, et quod superfuerit, a principio
275 eiusdem praecedentis numeres, et cetera sicut prius. Et invenies diem
et horam, minutum et secundum, quo luna soli coniungetur sive
opponetur per motus medios ad meridianum Parisiensem, in meridie
hesterna die hac incepta.

(39) Sed diligenter caveas ut, si tempus edirecto Ianuarii inventum
280 modo qui dictus est aliquando addideris, quae edirecto eiusdem ex
aliis titulis fuerint, ab aliis prius collectis minuas, quodlibet scilicet ab
alio sui generis.

(40) Et habebis per primum aliorum trium generum medium
motum solis et lunae, quod est distantia epicycli lunae, vel eius
285 nadair, ab ariete ad horam primo extractam. Per secundum autem
habes argumentum lunae verum, quod est distantia lunae ab auge
vera epicycli secundum motum lunae in epicyclo considerata; per
ultimum vero, ex quo primo possibilitatem eclipsis arguisti, argu-
mentum latitudinis, quod est arcus orbis cadens inter centrum
290 epicycli lunae et caput draconis in hora mediae coniunctionis vel
oppositionis.

(45) *Via communis procedendi in utraque eclipsi.* De eclipsi igitur utriuslibet luminaris intendens, via hac communi incedas: Inventa enim possibilitate, scribantur dicta 4 capitula, scilicet argumentum latitudinis, et argumentum lunae, medius motus solis et lunae, et tempus omnium horum. Deinde simile argumento latitudinis quaeras in alterutro laterum faciei instrumenti (4), et sub ultimo minuto eius statuas mediam lineam cursoris. **(46)** Locato autem sic cursore, quaeras in eo (9) simile medio motui solis et lunae, et super ultimum eius gradum ponas alteram fiduciarum novellae solis. Quaeras etiam simile argumento lunae (10), et super ultimum minutum eius ponas alteram fiduciarum novellae lunae, sic ut quantum ad utrumque utaris fiducia dextra in sinistra parte cursoris et e contra. **(47)** Et notentur loca novellarum in arcu aequationum (8): quod enim de ipso fuerit inter lineam mediam cursoris et novellam solis, erit aequa-

§ 44 (Mart., med.mot.) 18': NF; 19 ex computatione (Iun., med.mot.) 37': NF; 38 comp. (Dec., arg.lun.) 48': F, comp.; 49 N (Dec., med.mot.) sub columna 11,5,15,37 add.quidam

300 alteram: ultimam Na.c.

tio solis; quod etiam de eodem arcu fuerit inter eandem lineam mediam et novellam lunae, erit aequatio lunae. Quod vero inter utrasque novellas fuerit, est corporalis distantia solis et lunae, vel eius nadair, secundum medios motus coniunctorum, quod vocatur longi-
 310 tudo, et dicatur illius, cuius novella fuerit ad sinistram magis; quod etiam inter eas fuerit de arcu duodecimae longitudinis (16), erit duodecima longitudinis praesentis. (48) Quae quia correspondet motui solis in tota longitudine, ad quantitatem eius moveas novellam solis in arcu aequationum (8), recedendo semper a novella lunae
 315 stante; et quod post motum fuerit de arcu aequationum inter lineam mediam cursoris et novellam solis, si in parte dextra fuerit, de medio motu solis minuatur, vel eidem addatur, si fuerit in sinistra; et habebis verum locum solis ad horam coniunctionis vel oppositionis in octavo orbe, unde fit, ut iste sit locus coniunctionis vel oppositio-
 320 nis corporalis in octavo orbe.

(49) Notetur etiam in eodem arcu aequationum, quod fuerit inter utrasque novellas, et haec erit longitudo cum duodecima. Videatur etiam, quantum de tempore longitudinis (14) fuerit inter easdem; et hoc erit praesentis longitudinis et suae duodecimae tempus, sed ea
 325 condicione, ut sit luna in sua longitudine longiori; quod si ibi non fuerit, videatur, quantum inter dictas novellas fuerit de differentia duarum longitudinum (15). (50) Quibus extra scriptis, notetur locus novellae lunae in gradibus limbi (4); et habebis argumentum latitudinis quod apud aequantes vocatur argumentum latitudinis primo
 330 aequatum, quod est distantia lunae a capite draconis in hora mediae coniunctionis vel oppositionis. (51) Notetur iterum locus novellae solis in gradibus limbi; et habebis argumentum latitudinis quod aequantes vocant secundo aequatum, quod est distantia lunae a capite draconis in hora coniunctionis vel oppositionis verae.
 335 (52) Videas igitur, si haec novella solis plus 13 gradibus et 15 minutis a nodo distiterit, quia non erit eclipsis lunae possibilis ista vice; si etiam plus 12 gradibus ab eodem nodo elongata fuerit, impossibile est fieri eclipsim solis.

(53) *Usus tabulae portionis.* Ad aequandum igitur in posterum singula
 340 absque multiplicatione et divisione, tabulam portionis (113) composui, cuius usus est iste: Cum duorum numerorum portionem unius

volueris secundum proportionem alterius ad 60, ut in aequationibus planetarum plerumque accidit, unum horum, quem volueris, quaeras in capite alicuius columnae dictae tabulae portionis, et alterum in
 345 latere eiusdem columnae; et quod in cellula communi fuerit, erit portio quam volebas, ita quod numerus superius scriptus in dicta cellula erit eiusdem generis cum numero, cuius portionem quaerebas, et qui inferius, posterioris. Verbi gratia, si de 49 secundis portionem volueris secundum proportionem 39 minorum ad 60 minuta,
 350 tunc in capite alicuius columnae dictae tabulae inuenies 49 et in latere eiusdem 39, vel e converso; et in cellula communi stabunt 31 secunda superius et 51 tertia inferius, eadem proportione in aliis servata. Si etiam in alterutro numerorum sint diversa genera fractionum, cum quolibet sui et reliquo divisim intres, et quae inveneris
 355 aggredes, quodlibet ad aliud sui generis. Si etiam in utroque sint diversa genera, cum quolibet unius et quolibet alterius intres seorsum. Si etiam alicuius numeri portionem volueris secundum proportionem alterius ad 30 minuta, sicut contingit, cum extrahere oporteat aliquid ex tabulis crescentibus per dimidium gradum, modo
 360 iam dicto opereris, et quod inveneris duples, praeter ultimum, si minus sit 30.

(54) *Modus aequandi tempus longitudinis et per ipsum tempus coniunctionis vel oppositionis verae.* Consequenter resumatur argumentum lunae, et addatur ei medietas longitudinis et duodecimae primo, et tota longitudo
 365 cum duodecima secundo, si solis fuerit longitudo, vel eadem ab eodem minuatur / seorsum minuas, si lunae fuerit longitudo; et cum argumento lunae sic aequato intres, et quod edirecto eius
 370 vel minoris proximi fuerit, de minutis proportionalibus (114) sumas. (55) Quibus habitis, cum eis
deinde cum his argumentis lunae aequatis tabulam minorum proportionalium (114) seorsum intres, et minuta edirecto utriusque vel minoris proximi sumas; et minuta primo sumpta vocentur minuta proportionalia prima, et secundo secunda. (55) Hoc igitur facto, cum minutis primis

360 duples--30: NF 362-3 coniunctionis v. o. verae: om. rubricator & in mg. add. Na, exemplar ab Nb praescriptum secutus 364-5 primo--secundo ins. Na
 365 eadem: Na; eadem N 366 minuatur/seorsum minuas: N/Na
 367-74 (col. 1): N; (col. 2) Na 368 aequato: aequato tabulam minorum proportionalium F

375 et differentia duarum longitudinum prius (49) sumpta in instrumento
 tabulam portionis (113) modo supradicto intres, et partem propor-
 tionalem, quam ibi inveneris, semper demas de tempore longitudinis
 et duodecimae sumpto etiam ex instrumento; et residuum erit
 380 tempus longitudinis et duodecimae ad longitudinem lunae praesen-
 tem, (56) sed aliquando non praecisum, nec videbatur possibile
 errorem non incidere aliquem. Eum autem corriges isto modo:
 Intrans cum minutis proportionalibus tabulam erroris tollendi (117),
 minuta, quae edirecto eorum fuerint, considera. Pro tot enim minutis
 de tempore longitudinis et duodecimae deminutis residuo semper
 385 unum addas, et praecise aequatum erit. Erit igitur tempus nunc
 aequatum, quod cadit de tempore inter ambas coniunctiones vel
 oppositiones, mediam scilicet et veram.

(57) Videas igitur, cuius erat longitudo; et si solis fuerit, quia tunc
 media coniunctio vel oppositio praecedit veram, addatur tempus
 390 longitudinis nunc aequatum super tempus coniunctionis vel opposi-
 tionis mediae; vel idem ab eodem minuatur, si longitudo lunae fue-
 rit, quia tunc vera coniunctio vel oppositio praecedit mediam; et
 quod post additionem vel minutionem fuerit, erit tempus coniunc-
 tionis vel oppositionis verae, sed ea condicione, ut dies naturales
 395 omnes sint aequales. (58) Quia igitur propter inaequalitatem ascen-
 sionum both solis, superadditarum revolutionibus caeli diurnis, dies
 naturales efficiuntur inaequales, excrementum inaequalitatis, quod
 vocatur aequatio dierum, cum gradu solis accipitur. Vero igitur loco
 solis in octavo orbe addas motum orbis eiusdem, qui nunc est 10
 400 graduum et tertiae unius; et habebis locum solis in nono orbe, cum
 quo tabulam aequationis dierum (115) intres, et aequationi edirecto
 eius vel minoris proximi ascriptam dicto tempori verae coniunctionis
 vel oppositionis semper addas; et habebis tempus verae coniunc-
 tionis vel oppositionis, diebus aequatis ad
 405 meridianum civitatis, cuius longitudo ad orientem de | Parisius.
 Parisius est 32 minutorum temporis.

Et haec est illa, de qua dixi, in omni eclipsi communis via.

384 deminutis: de min. N 398-406 vero igitur--orbe. . .et habebis--temporis:
 de F v.praef. §2 401 dierum intres: i.d. notis inv. N 405-6 (col. 1): N; (col. 2)
 ?Nb

(59) *Via specialis pro punctis et dimidio durationis eclipsis lunaris.* Via autem speciali pro eclipsi lunae complenda sic procedas: Fiduciam enim dextram novellae utriuslibet ponas super argumentum latitudinis secundo aequatum (51) in dextro latere (4), et sinistram alterius super consimile in sinistro; et habebis ad sinistram (5) puncta et minuta de diametro lunae eclipsanda, ad dexteram autem (6) dimidium durationis eiusdem, sed ea condicione, ut sit luna in sua
415 longitudine longiori.

(60) *Aequatio praemissorum.* Si igitur alibi fuerit, cum argumento latitudinis secundo aequato tabulam (118) differentiae duarum longitudinum
420 in punctis eclipsis intres[, et quod edirecto eius fuerit, semper addas punctis et minutis in instrumento inventis]. Si etiam tabulam bis intrare oporteat, cum differentia duorum introituum, quae stat ad dextram, et cum minutis, pro quibus secundo intraveris, tabulam portionis (113) intres, et quod in angulo communi fuerit duplex, et duplatum primo addas. Et erit differentia duarum longitudinum in punctis aequata, cum qua et minutis proportionalibus secundis (54) intres tabulam portionis, et quod inveneris punctis et minutis, quae in instrumento invenisti, semper addas.
430 et quod inveneris duplans, cum cautela ibidem tradita, addas supra id quod ad primum introitum invenisti, si ipsum secundo minus fuerit; si vero maius, idem
435 minuas ab eodem. Et erit differentia aequata in punctis, quam <***> semper addas punctis et minutis ex instrumento acceptis.

Et habebis puncta et minuta de diametro lunae eclipsanda ad
440 locum lunae praesentem, quae in particulari eclipsi versus meridiem numeranda sunt, si argumentum latitudinis, per quod puncta sumpta sunt, 0 vel 5 sit in signis; si vero 6 vel 11, versus septentrionem.

(61) Consimiliter quoque operaberis pro differentia earundem longitudinum in dimidio durationis, intrando tabulam (119) ad hoc
 445 constitutam, et differentiam aequatam addas semper dimidio durationis quod ex instrumento accepisti; et habebis dimidium durationis eclipsis, sed non praecisum. (62) Cum minutis igitur proportionalibus tabulam erroris tollendi (117) intres, et pro tot minutis, quot ibi inveneris, unum de dicto dimidio durationis tollas. (63) Et erit
 450 dimidium durationis aequatum, quod si de tempore oppositionis verae, quod est tempus mediae eclipsis, minueris, remanebit hora initii eclipsis; et si idem eidem addideris, exhibit eius finis; si etiam ipsum duplaveris, habebis totalem eclipsis durationem.

(64) *Inventio morae.* Nec te etiam latere convenit, si quando eclipsis
 455 universalis fuerit, quantam moram luna faciet in umbra. Est autem mora tempus deambulationis lunae in umbra terrae absque lumine solis. Pro mora igitur habenda, cum dicto argumento latitudinis secundo aequato tabulam (120) dimidii morae intres, et minuta quae inveneris extra scribas. Si etiam bis intrare oporteat, opereris cum
 460 differentia duorum introituum et minutis, pro quibus secundo intraveris, sicut in capitulo proximo dicebatur (60); et habebis dimidium morae, ea autem condicione sicut supra, ut sit luna in sua longitudine longiori. (65) Ea igitur alibi existente, cum eodem argumento latitudinis tabulam (116) differentiae duarum longitudinum in dimidio morae intres, et opereris per omnia sicut prius,
 465 quodque aequando inveneris, dimidio morae nunc invento semper addas; et habebis dimidium morae ad locum lunae praesentem. Sed quia nec hoc omnino praecisum est, opereris sicut in capitulo proximo nunc (62) dictum est. (66) Et erit dimidium morae aequatum,
 470 quod si de tempore mediae eclipsis minueris, remanebit initium morae, quod est instans extinctionis lunae totalis; et si idem eidem addideris, exhibit finis morae, qui est instans primae reaccensionis lunae; si etiam idem duplaveris, exhibit mora totalis.

(67) *Modus investigandi utrum eclipsis futura sit in nocte.* Ad sciendum
 475 autem, an eclipsis inventa futura sit de die vel de nocte tota vel in parte, cum gradu solis in nono orbe (58) tabulam (121) temporis diurni ad clima tuum vel civitatem intres, et medietatem temporis diurni, quod edirecto eius steterit, extra scribas; et hoc erit tempus a meridie ad occasum solis in die gradus solis. Similiter quoque extra
 480 scribas tempus diurnum, quod e directo nadair gradus solis fuerit; et

hoc erit tempus noctis gradus solis. Addito igitur hoc ad primum, exhibit tempus a meridie diei praecedentis ad ortum solis in sequente. Videas ergo, si tempus finis eclipsis fuerit minus 12 horis: erit enim tunc ante mediam noctem eclipsis tota. Si etiam tempus initii eclipsis
 485 fuerit maius 12 horis, erit post mediam noctem eclipsis tota. **(68)** Si igitur ante futura sit, medietatem temporis diurni subtrahas de quolibet temporum eclipsis seorsum, et residuum cuiuslibet ostendet horam sui post occasum solis. A quocumque vero non potuerit subtractio fieri, hoc in die erit, et ante occasum solis secundum differentiam utriusque. Si vero post mediam noctem futura sit, medietatem temporis diurni iungas tempori suae noctis, et ab aggregato tollas unumquodque temporum eclipsis seorsum; et scies per residuum,
 490 quantum unumquodque futurum sit ante ortum solis. Sed si aliquod horum tolli non potuerit, hoc iterum in die erit, et post ortum solis
 495 secundum differentiam utriusque.

Et haec plerumque sufficiunt pro eclipsi lunae.

(69) *Via specialis de eclipsi solis, utrum coniunctio futura sit in die.* Aliter autem procedas deinceps in eclipsi solis: Inventis enim argumento latitudinis, quod secundo aequatum dicitur (51), et tempore coniunctionis verae (58), videndum est, utrum haec coniunctio sit diurna vel non, et si diurna, utrum ante meridiem vel post. Ad hoc ergo sciendum tabulam (121) temporis diurni cum gradu solis, ut in capitulo proximo (67) dictum est, intres, et medietatem temporis gradus solis et tempus totale nadair extra divisim scribas. Sique tempus
 505 coniunctionis verae minus fuerit medietate temporis gradus solis, erit illa coniunctio in die, et ante occasum solis secundum differentiam utriusque. Si vero tempus coniunctionis medietate eadem maius fuerit, eidem medietati tempus nadair superaddas; et si aggregatum minus fuerit tempore coniunctionis, erit iterum illa coniunctio in die,
 510 et post ortum solis secundum differentiam utriusque. Si vero tempus coniunctionis fuerit plus medietate temporis gradus solis et minus aggregato, erit de nocte, et non erit ulterius laborandum.

(70) *Inventio diversitatis aspectus in longitudine et latitudine.* Invento autem quod coniunctio futura sit de die, cum tempore coniunctionis
 515 verae operaberis, si sit post meridiem; si vero ante, tunc tempus

coniunctionis verae de 24 minuens cum residuo operaberis. **(71)** Cum utrolibet ergo tabulam (122) diversitatis aspectus ad clima tuum vel civitatem intres sub signo coniunctionis, et ante titulum Recessus, si futura sit ante meridiem, vel post, si post sit futura, et diversitatem
 520 aspectus tantum in longitudine edirecto stantem accipias; et si pro minutis horae secundo intrare oporteat, cum eis et differentia duorum introituum tabulam portionis (113) modo consueto intres, et quod inveneris, aspectui primi introitus semper addas; et erit diversitas aspectus <aequata> pro parte horae ad signum coniunctionis. **(72)**
 525 Sicque facias intrando sub sequente signo, si coniunctio non fuerit in principio signi; et erit aspectus aequatus pro parte horae ad signum sequens. Deinde videas, quot gradibus distet haec coniunctio a principio signi, et quae sit differentia amborum aspectuum; et cum utrisque tabulam portionis intrans, quod inveneris duples, et dupla-
 530 tum aspectui primo addas, si minor sit secundo, vel idem ab eodem minuas, si sit maior; et erit aspectus aequatus pro parte horae et pro parte signi. **(73)** Cum quo et minutis proportionalibus secundis (54) tabulam portionis intres, et quod ibi inveneris, eidem aspectui addas, si minuta proportionalia plura fuerint 29, vel idem ab eodem minuas,
 535 si fuerint pauciora; et erit diversitas aspectus aequata pro parte horae, pro parte signi et pro parte epicycli. **(74)** Cum qua tabulam (123) temporis aspectus et differentiae intres, et quod ibi de tempore aspectus et de differentia duarum longitudinum fuerit, seorsum extra scribas. **(75)** Deinde cum ipsa differentia et secundis minutis
 540 proportionalibus tabulam portionis intrans, quod ibi inveneris, de tempore diversitatis aspectus semper minuas; si etiam diversitas ipsa maior 60 minutis fuerit, primo pro 60 et secundo pro residuo intres. Et erit tempus diversitatis aspectus aequatum primo, quod semper
 545 addendum est tempori, cum quo tabulam diversitatis aspectus intrasti.

(76) Hoc facto, cum tempore excrescente eandem tabulam diversitatis (122) et sub eisdem signis intrans, per omnem modum facias sicut prius; et tempus diversitatis aspectus, quod in fine inveneris, addas eidem tempori cui et prius addidisti. **(77)** Adhuc cum tempore
 550 nunc excrescente eandem tabulam diversitatis, et sub eisdem signis, tertio intrans, accipias de utraque diversitate aspectus, scilicet in

longitudine et latitudine, et utramque aequas seorsum ad partem horae, ad partem signi et ad partem epicycli, sicut alteram solam prius bis aequasti. Et erit diversitas aspectus in longitudine sic
 555 aequata arcus orbis cadens inter locum lunae, in quo est corporaliter, et locum ad quem proicitur visibiliter versus orientem vel occidentem; diversitas vero aspectus in latitudine est arcus orbis cadens inter eadem loca versus austrum sumptus.

(78) *Usus diversitatis aspectus utriusque.* Omnino autem sicut prius
 560 cum hac diversitate aspectus in longitudine intres tabulam (123) temporis aspectus, et quod ibi aequando inveneris, addas iterum illi tempori cui iam bis addidisti; et de tempore, quod nunc excreverit, tollas id quod per tabulam (117) erroris tollendi per ea quae supradicta sunt est tollendum; et tempus, quod remanserit, erit
 565 coniunctionis visibilis, quod est tempus mediae eclipsis, a meridie ante vel post numerandum.

(79) Item cum eadem diversitate aspectus in longitudine intres tabulam (124) duodecimae cuiuslibet numeri, et quod edirecto eius inveneris, eidem addas; et habebis diversitatem aspectus in longi-
 570 tudine cum sua duodecima, quae est arcus orbis a loco lunae in hora coniunctionis verae ad locum eiusdem in hora coniunctionis visibilis versus orientem vel occidentem protensus. Et ideo addere oportet hunc arcum supra locum lunae in nono orbe sumptum et supra argumentum latitudinis secundo aequatum, si coniunctio futura sit
 575 ante meridiem, vel eundem ab eisdem minuere, si post meridiem sit futura; et habebis locum lunae ad horam coniunctionis visibilis, et similiter argumentum latitudinis tertio aequatum, quod est arcus orbis cadens inter caput draconis et locum in quem luna ad visum est proiecta.

(80) Hoc expedito transferantur novellae ad dorsum instrumenti, et quaeratur simile (18) argumento latitudinis tertio aequato, quod si in dextro latere inveneris, super ipsum statuas sinistram fiduciam novellae solis, vel dexteram, si fuerit in sinistro. Locata igitur fiducia, quaeras in circulo (13) diversitatis aspectus in latitudine simile diver-
 585 sitati aspectus in latitudine iam aequatae, et ibi posita novella lunae, notetur locus eius in limbo (18); et habebis argumentum latitudinis

quarto aequatum, quod est arcus orbis cadens inter caput draconis et terminum lineae exeuntis a loco lunae visibili, aequedistanter eclipticae, quae est via solis.

590 **(81)** Stante autem novella lunae in hoc situ, ponas novellam solis super argumentum consimile in alio latere; et habebis puncta et minuta eclipsis solaris ad sinistram (19) et dimidium durationis ad dexteram (21), ea autem ut supra condicione, ut sit luna in sua longitudine longiori. **(82)** Alibi vero ea existente, videas diligenter distantiam novellarum a nodo, et in eadem distantia hinc inde a nadair
595 nodi ponas easdem; et habebis differentiam duarum longitudinum in punctis ad sinistram (20) et differentiam earundem longitudinum in dimidio durationis ad dexteram (22), et haec divisim serves. Deinde cum secundis minutis proportionalibus (54) et differentia in punctis
600 tabulam portionis (113) intrans, quod inveneris punctis et minutis prius acceptis semper addas; et erunt puncta eclipsis solaris aequata, quae sunt partes duodecimae diametri solaris eclipsanda. Intres consimiliter eandem tabulam portionis cum differentia in dimidio durationis et eisdem minutis proportionalibus; et quod inveneris,
605 dimidio durationis addas, si ipsum dimidium durationis minus fuerit 44 minutis, vel idem ab eodem minuas, si sit maius. Et erit dimidium durationis eclipsis solaris aequatum, quod si de tempore mediae eclipsis minueris, remanebit tempus initii eclipsis, et cetera, sicut supradictum est de luna (63). Quae etiam pars solis eclipsanda
610 fuerit, scies sicut ibi dicebatur (60).

(83) *Investigatio temporis longitudinis et duodecimae.* Ne autem, parvo quandoque existente instrumento, in acceptione temporis longitudinis et duodecimae in utraque eclipsi aliquod contingat dubium, longitudinem ipsam cum duodecima diligenter ab instrumento extrahas,
615 sicut supradictum est (49); et cum ea tabulam (125) temporis longitudinis et duodecimae intrans, invenies edirecto eius suum tempus, ea condicione, ut sit luna in sua longitudine longiori. Quod si bis intrare oporteat, cum differentia duorum introituum et minutis, pro quibus

ad N **590** ante §81 add. F nunc quoque diligenter videas distantiam no(vel)lae lunae a nodo in partem alterutram, quae si fuerit 7 in gradibus et plus 10 minutis, impossibile erit hac vice eclipsim solis fieri, si vero minor fuerit, ponas no(vel)lam solis. . .

608 eclipsis: solaris add. & del. N **617** longitudine: om. & in mg.ins. N

secundo intraveris, tabulam portionis intrans, quod inveneris duples,
 620 et duplatum tempori primi introitus addas; et habebis tempus longi-
 tudinis et duodecimae, de quo dubitabas. Tempus autem differen-
 tiaearum longitudinum (15) praecise satis ex instrumento habebi-
 tur cum aliis, quae sunt necessaria ad eclipsim.

(84) *Ratio eorum, quae circa compositionem et usum instrumenti dicta sunt.*

625 Expedito eo quod intendebatur ab initio, ut 'propter quid' viso audi-
 tor factus scientior fidem omnimodam dictis accommodet, visum est
 perutile singulorum, quae in compositione et usu instrumenti, immo
 simpliciter eorum, quae in investigatione utriusque eclipsis dicta sunt,
 reddere rationes.

630 (85) Constitui igitur in facie instrumenti utrimque a nodo 14
 gradus argumenti latitudinis lunae (4), non quia meta eclipsis ultra 13
 gradus et 16 minuta sit possibilis, sed propter circulum minorum
 aspectus addidi quod est ultra. (86) Puncta etiam et minuta eclipsis
 635 lunaris aequavi pro argumentis latitudinis singulis, et singulis apposui
 singula a nodo sinistrorsum (5); dimidium autem durationis argu-
 mentis similibus ascripsi dextrorsum ab eodem nodo (6); sed hoc erat
 ad placitum, quia poteram latera permutasse; sicque feci in dorso (19,
 21), addendo ibi quaedam (20,22), ne vacarent loca.

(87) Quia in hora coniunctionis mediae linea medii motus solis est
 640 eadem cum linea medii motus lunae, cuius pars est diameter epicycli
 ad augem vadens, sequitur quod diameter haec epicycli ad orbem
 ducta terminet motum medium utriusque; et ob hoc circa eandem
 lineam, quae est media cursoris (7), ordinavi deferentem solis et epi-
 cyclum lunae (9,10). (88) Et quia aequationes solis, sicut et lunae, ab
 645 auge incipiunt, lineam eandem mediam posui communem etiam dia-
 metro deferentis solis ab auge ad oppositum descendentem. (89) Item,
 quia maxima remotio solis corporaliter a linea medii motus sui est ad

627 immo simpliciter: nec non et F

630-3 14 gradus...non quia--ultra: 12 gradus...non quia extra hanc metam
 luna existens eclipsari non possit sed quia, centro epicycli lunae in oppositione vel
 coniunctione media extra hanc metam existente, impossibile est eclipsim fieri sive
 solis sive lunae F 638 addendo--loca: suo modo F 640 epicycli ad: orbem
 ducta ex inferioribus add. & del. N

unum gradum orbis et 59 minuta, quae dicuntur maxima solis
 aequatio, ideo pro deferente solis tantundem accipi de argumento
 650 latitudinis, quod partium est zodiaci, et signavi in cursore. **(90)**
 Consimiliter, quia maxima remotio lunae corporaliter a linea medii
 motus sui est ad 5 gradus et unum minutum, quae dicuntur maxima
 lunae aequatio, ideo etiam pro epicyclo lunae tantundem accipi de
 argumento latitudinis in cursore. **(91)** Ex quo videbatur consequens
 655 ponere arcum communem, infra quem omnes aequationes solis et
 lunae cadunt, et hunc supra deferentem solis posui, vocans eum
 propter dicta arcum aequationum (8). Epicyclumque lunae sub
 deferente solis statui secundum ordinem universi. **(92)** Deinde epi-
 cyclum (10) et zodiacum (9) divisi in suas partes secundum aequa-
 660 tiones singularum, ut, accepto medio motu solis et argumento lunae,
 statim habeatur utriusque aequatio et verus locus.

– **(93)** Adhuc, quia sol et luna per medios motus coniuncti possunt
 per dicta ad 7 gradus distare corporaliter abinvicem, ideo propter
 motum solis 35 minuta, quae sunt totalis longitudinis duodecima,
 665 ordinavi (16) hinc inde a rostro novellae solis, ad quantitatem gradus
 limbi 5 minutis sumptis. **(94)** Et quia, tempore motus solis per haec
 35 minuta, movetur luna per 7 gradus et eadem 35 minuta, conse-
 quens est quod locus lunae in hora mediae coniunctionis vel
 oppositionis distare potuerit a loco suae verae coniunctionis vel
 670 oppositionis 7 gradibus et 35 minutis, quae dicuntur maxima
 longitudo cum sua duodecima; **(95)** quam per 30 minuta et 12
 secunda, quae sunt motus lunae aequalis et aequatus in una hora ad
 augem epicycli, divisi, et 15 horas cum quintadecima unius, quae
 provenerunt, ordinavi (14) in eadem novella solis hinc inde a rostro
 675 sub 7 gradibus et 35 minutis limbi. **(96)** Deinde eandem longitudi-
 nem divisi per motum lunae aequalem et aequatum in una hora ad
 oppositum augis, scilicet per 36 minuta et 10 secunda, et 12 horas
 cum 35 minutis, quae provenerunt, subtraxi de horis et minutis
 primis; et 2 horas cum 29 minutis, quae remanserunt, ordinavi (15)
 680 sub prioribus et sub dictis 7 gradibus et 35 minutis limbi. –

(97) Ex his patet, quare media linea cursoris ordinari debeat sub
 ultimo minuto argumenti latitudinis in principio eclipsis examinan-

670-80 quae--limbi: *post alia pauca* tempus enim huius longitudinis commodius in
 dorso ordinavi F

dae (45), cum argumentum illud est distantia epicycli lunae a capite draconis. **(98)** Ex hoc etiam sequitur quod, posita novella solis supra
 685 medium motum solis in cursore (46), quod de arcu aequationum fuerit inter eandem novellam solis et lineam mediam cursoris, erit aequatio solis (47); et similiter quod, posita novella lunae super argumentum suum, quod de eodem arcu aequationum fuerit inter eandem novellam et lineam mediam cursoris, erit aequatio lunae; et
 690 quod de eodem arcu aequationum fuerit inter ambas novellas sic stantes, erit corporalis distantia inter solem et lunam, quae longitudo dicitur; et quod inferius de arcu duodecimae longitudinis fuerit inter easdem novellas, erit duodecima acceptae longitudinis. **(99)** Et quia sol hanc perambulat, ideo ad quantitatem huius duodecimae movere
 695 oportet novellam solis in arcu aequationum, recedendo semper a novella lunae (48), ut habeatur locus verae coniunctionis vel oppositionis. **(100)** Et quod de tempore longitudinis fuerit nunc inter ambas novellas (49), erit tempus quod fluit inter ambas coniunctiones vel oppositiones, supposito quod luna sit in auge; et quod sub illo
 700 fuerit, erit differentia duarum longitudinum, quam cum minutis proportionalibus aequare oportebit.

(101) Aequatur autem argumentum lunae per medietatem longitudinis et duodecimae (54) propter motum lunae in epicyclo, qui fere tantus est sicut motus epicycli, ut habeatur argumentum lunae ad
 705 instans medium inter ambas coniunctiones vel ambas oppositiones; sed non additur vel subtrahitur hic tota longitudo cum duodecima, quia sic haberetur argumentum lunae ad veram coniunctionem vel oppositionem, ubi notabiliter fingeretur vel plus vel minus debito moveri in toto tempore longitudinis et duodecimae. Aequando autem
 710 ad instans medium, licet in prima medietate erretur in aliquo, in secunda ad aequalitatem reducitur.

(102) Et quia non est aliud argumentum latitudinis primo aequatum (50) nisi distantia lunae corporaliter a capite draconis in hora mediae coniunctionis vel oppositionis, ideo hoc argumentum accipitur
 715 per novellam lunae. Similiter, quia non est aliud argumentum latitudinis secundo aequatum (51) nisi distantia lunae corporaliter ab eodem capite draconis in hora coniunctionis vel oppositionis verae, scilicet quando luna est cum sole, ideo argumentum latitudinis

secundo aequatum accipitur cum novella solis. **(103)** Item quia, ubi
 720 est luna in oppositione vera, ibi est diameter umbrae terrae, ideo,
 cum per locum lunae in hora oppositionis verae habetur argumen-
 tum latitudinis secundo aequatum, habentur et puncta et minuta
 eclipsis lunae ex consequenti (59). Et quia tanta eclipsis fit in tanto
 tempore, cuius dimidium est positum in alio latere, ideo cum argu-
 725 mentis latitudinis consimilibus accipitur quantitas eclipsis, de qua
 nunc dixi, et dimidium durationis eiusdem. – **(104)** Sed quia multi-
 tudo inscriptionum deformitatem instrumento et errorem forsitan
 operanti induceret, placuit per distantiam novellarum a nodo accipi-
 endum esse dimidium morae (64) in tabulis ad hoc factis.

730 **(105)** In coniunctione autem vera, quia luna non videtur sub illa
 parte orbis, sub qua est, sed ante meridiem orientior et post occi-
 dentalior fit visibiliter plurimum, et semper cum hoc australior
 quam est in veritate, erit arcus orbis inter locum, sub quo vere est, et
 locum, sub quo est visibiliter, partim versus orientem vel occidentem
 735 et partim ad austrum numerandus. **(106)** Sumptus autem ad orien-
 tem vel occidentem dicitur diversitas aspectus in longitudine; sump-
 tus vero versus austrum dicitur diversitas aspectus in latitudine.
 Dicitur autem uterque diversitas aspectus, quia ad diversitatem
 aspicientium fit et diversificatur. Primus etiam dicitur in longitudine,
 740 quia mensuratur secundum partes orbis sive zodiaci in longitudine;
 secundus vero dicitur in latitudine, quia ad partem orbis vel zodiaci
 secundum latitudinem mensuratur. **(107)** Cum igitur motus lunae sit
 ad orientem, prius erit soli coniuncta visibiliter quam vere ante
 meridiem, et post e converso; et ideo tempus diversitatis aspectus, et
 745 suae duodecimae propter motum solis, additur (75) ad tempus a
 meridie praesenti in utramque partem, ut habeatur tempus con-
 iunctionis visibilis; et iam statim haberetur, si eadem esset diversitas
 aspectus lunae in loco, ad quem tracta est, cum ista quam invenisti
 ad locum coniunctionis verae. **(108)** Sed erit utrarumque diversita-
 tum diversitas aequalis; et ideo, supposito lunam esse in hoc secundo
 750 loco, cum tempore arcus inter hunc locum lunae secundum et meri-
 dianum accipitur diversitas aspectus in longitudine secundo (76); et
 erit semper maior primo; et huius et suae duodecimae tempus addi-

732 fit: F; fit *vel* sit N **738** uterque: NF **739-41** primus...secundus:
 prima...secunda F **752-3** secundo...primo: secunda...prima F **760** ea:

tur eidem tempori, cui primo addebatur. Sed nec erit luna adhuc
 755 necessario inter nos et solem, sed erit aliquando et huius loci diverse-
 sitas diversa secundum aliquid a secunda; et ideo tertio cum tempore
 arcus inter hunc locum et meridianum accipitur diversitas sicut prius
 (77), et eius tempus et suae duodecimae additur tempori, cui primo
 addebatur. Sed si cum tempore, quod nunc excreverit, intres tabulam
 760 ut prius, nullam invenies diversitatem sensibilem ab ea quae tertio
 est inventa; et ob hoc intrando tertio tabulam accipitur diversitas et in
 latitudine sicut in longitudine. **(109)** Aequatur autem ter qualibet
 vice (71-73), quia compositor tabulae supposuit coniunctionem esse
 in principio signi illius, in quo fit, et in complemento horae, et
 765 lunam in longitudine media epicycli, et quia ad haec puncta sumpta
 diversitas diversa erit ad quaecumque alia, tum propter esse lunae
 superius vel inferius in epicyclo, tum propter accessum vel recessum
 lunae ad zenith vel ab eodem, et tum etiam propter distantiam solis
 maiorem vel minorem ab orbe lunae. **(110)** Ex dictis patet quare, ad
 770 habendum locum lunae et argumentum latitudinis in hora coniunc-
 tionis visibilis, diversitatem aspectus in longitudine cum sua duode-
 cima loco lunae et argumento latitudinis in hora coniunctionis verae
 addi oporteat post meridiem, et ante minuere ab eodem (79): quia
 coniunctio visibilis veram praecedat ante meridiem, et post e con-
 775 verso.

(111) Adhuc, quia diversitas aspectus in latitudine est arcus proie-
 ctionis lunae ad austrum visibiliter, qui sic se habet ad arcum deferentis
 lunae sicut unum ad XI cum dimidio – ad arcum, dico, deferentis
 lunae, qui est inter locum lunae in hora coniunctionis visibilis et
 780 punctum sui, quod tantum distat ab ecliptica quantum locus visibilis
 lunae – et ob hoc, posita novella solis super argumentum latitudinis
 tertio aequatum et novella lunae super diversitatem aspectus in latitu-
 dine, habetur argumentum latitudinis quarto aequatum (80), quia
 cuilibet minuto aspectus XI minuta cum dimidio de limbo cor-
 785 respondent. Unde, cum diversitas aspectus in latitudine sit arcus
 orthogonaliter a loco lunae visibili in deferente per partes latitudinis
 zodiaci protensus, erunt partes sibi de limbo correspondentes arcus a
 loco projectionis lunae aequedistanter ductus eclipticae ad contac-

tum deferentis. (112) Ex quo sequens est, quod locus contactus
 790 huius arcus paralleli cum deferente lunae et locus projectionis eius-
 dem aequedistent; ex quo ulterius sequitur quod, quantum eclipsa-
 ret luna de sole in dicto puncto contactus, tantum eclipsabit de eo in
 loco suae projectionis, et e converso; et ideo nulli mirum, si quando-
 que luna extra metas eclipsis solaris existens corporaliter solem eclip-
 795 set, vel infra existens eum non contingat. Meta autem eclipsis solaris
 est 7 graduum et 11 minutorum ab alterutro nodorum.

789 *post* §111 *add.* F supra argumentum autem latitudinis tertio aequatum dextrá
 fiducia novellae solis posita circa caput draconis vel sinistra circa caudam, invenitur
 ex hoc arcu argumentum latitudinis quarto aequatum, in partem fiduciae positá
 novella lunae, sic enim faciendo intellegitur arcus iste ab argumento latitudinis
 tertio aequato circa caput minui et circa caudam addi, itur enim primo modo
 contra et secundo secundum signorum seu graduum successionem a novella solis
 in novella lunae **796** 7°11': 7°10' F nodorum: explicit *add.* & *del.* N

(113) <Tabula magistri Petri Philomenae de Dacia ad inveniendum portio-
nem cuiuslibet numeri secundum proportionem cuiuslibet alterius ad 60. Et
deservit prima columna utrisque minoribus 31; secunda alteri minori et alteri
maiori; tertia vero utrisque maioribus.>

computum metricum manuaem

§1. The text commented upon, the *Compotus metricus manualis* commonly ascribed to one Anianus (Walther no.3077; T&K 243) and datable by testimonies to the second half of the 13th century (Smith, below, p.22), has been often printed during the 15th and 16th centuries, and in modern times by Wordsworth (1904, 159 ff.) and Smith 1928, both with comments and lists of previous editions.

The *Declar(atio)* here reproduced apparently does not occur among those commentaries frequently accompanying the *Compotus* in the early prints. It was recorded from ms.V (below) by Berardelli (1782,70-1), then by Schück (1896,123) followed by Jørgensen (1910,260); extracts, with some readings used here, are given by these and by O.Pedersen 1976; and a transcription of ms.V was pre-published by myself (1979a), with a short introduction, used in the following. Since then, one or possibly two further manuscripts have come to notice, one of which (ms.N) has been used for the present text as auxiliary to ms.V.

§2. *Manuscripts.*

- V Venezia, Bibl. Nazionale Marciana, 8,18 (=3573). Paper,4°, ff.459; earlier at Dominican monastery of St.John and Paul at Venice. The relevant part consists of the 12 un-numbered leaves at the beginning of the manuscript, labelled I-XII below. According to the subscription at XIr, at least IIr-XIr were written in A.D.1494 by "magistrum Nicolaum de Ripis Venetum (or Venetiis)". He is also known from the logical ms. København, K.B., Thott 581,4°, part of which was written by "frater Nicolaus de Ripis ordinis praedicatorum 1473 decima mensis Augusti", in some Dominican house in Italy (Jørgensen 1923,362-4; *Colophons* IV, Fribourg 1976, no.14537; contents of ms., see Ebbesen and Pinborg *in* English Logic in Italy). The rest of ms.V, on numbered leaves, contains sermons, some of them certainly Dominican.

References: Kristeller II,1967,237b, and those mentioned in §1.

Ir-v (index to the numbered leaves: at the beginning is added:) *Primo de computo vide in primo quinterno.* **IIr-XI^r** (*Declar. super Comp.*: headings, text, and subscription as printed below.) **XIv** (Notes, printed below:) *Ad habendam veram revolutionem. . . Incipit abacus. . .*

The textual order of V is here followed, except that the texts of §4 and §5 occur in reverse order in V. The text of V has been partly revised to suit the Dominican Cisiojanus introduced as §35-46: this has happened in §58 (line 585 ff., cf. apparatus) and §69-70, but not in the short references in §53-55 and 58(line 583).

N Napoli, Bibl. Nazionale, V.H.16. Paper, 22 × 14½, ff.1+191, 15th c.; earlier at "locum S.Nicolai prope Sulmonam". The contents are mainly theological and liturgical. The section described below shows at least two hands, a cursive (=hand 1) and a book-hand (=hand 2), possibly by one and the same scribe.

Cenci, *Manoscritti francescani della B.N. di Napoli* I,1971,221-2 (reference from Hill Monastic Manuscript Library), with further refs. Kristeller I, 1965, 402a, these items not mentioned.

139v(=149v Cenci; blank.) **140r-v** (hand 1, Cisiojanus, with expansions.)
141r-v (blank.) **142r-143r** (hand 2, list of Easter limits, like *Calendar*, App.5(e1), hdg. :) *Ad inveniendum pasca per istam tabulam aurei numeri. Haec tabula numquam fallit neque cum bissexto neque sine bissexto, et ista approbata est.* **143v** (hand 1, possibly beginning of Bonus de Lucca's *Computus*, T&K 242:) *Computus est scientia certificandi tempus secundum solis et lunae progressum. . .secundum ascensum vel descensum crescit pariter et decrescit.*

144r-151r (hand 2, Anianus' *Computus*, with some marginal glosses not strikingly coincident with the *Declar.* Txt:) *Computus est talis. . .tribus illi prae-lata diebus(§81).* **151v** (blank.)

152r(=163r Cenci)-**163v** (hand 1, *Declar. super Comp.* No rubrics. Txt:) *Ut habetur. . .post argentum indixit aurum(§82).* **164r-167v** (other hands: notes devotional and moral.) **168r-170v** (treatise on confession.)

In N the Anianus-verses are kept apart from the *Declar.* and are represented there by lemmas or not at all. The text of the *Declar.* lacks §18 and the last half of §26. From §66 on, the following passages occur: §87, placed after §33; §(69)-70; §(77)-78; §(66)-68; §(81)-82, last half of §82 omitted. As concerns the passages of the *Declar.* common to N and V, neither witness shows extensive revisions relatively to the other; a lesser one was mentioned under V above.

I have not seen the manuscript Parma, Bibl. Palatina 178, from the 15th century (*Catalogo di manoscritti filosofici nelle biblioteche Italiane* 2,1981,p.152-3), no doubt Italian. It contains Bonus de

Luca's *Compotus*, then at 18r-36r the verses of Anianus, followed by the text "Ut habetur circa primum de anima, scientia est de bono et de difficili quod sic probatur. . . quotiens possumus et addere tres quia tot precesserat de indictione", with some of the last leaf and one further leaf missing. The end of the text just cited is not in N or V. The rest of the manuscript, until 41v, shows some common computational tables with canons.

§3. *Evidence for authorship, etc.*

The ascription to one "magister Petrus de Dacia" is textually secure from §2 of the *Declar.* The remaining statements bearing on the external circumstances of the text are found in V only, either in rubrics or in other passages which are omitted by N, as follows.

§3 and §87 show the names *expositio* and *declaratio* for our work: the latter has been chosen arbitrarily. §18 and the addition in V, f.XIv, mention the years 1320 and 1300 in examples, both of which are suspect: indeed, in the first instance the sum obtained is 100 years too great; as for the second one, the week-days do not fit the dates for the year 1300; and when discounting the week-days and looking for another year where the conjunction times are compatible with those in ms. Bs of the *Calendar*, f.6v+ and 14v, no such year is found between the years 1100 and 1500. Lastly, the example in §82 uses the year 1482, valid for the time when ms.V was written.

Thus the text seems to furnish no reliable evidence for its own title, place or date, nor anything to confirm that the "magister Petrus de Dacia" is indeed Peter Philomena. The external evidence is no more encouraging: as was seen, the three known manuscripts are all from the 15th century and probably all Italian. It may thus be permitted to reserve judgment until more witnesses become available.

§4. *The text edited.*

As concerns the passages of the *Declar.* which are in both V and N, a glance at the apparatus will show that these witnesses have some errors in common, and that each of them has errors against the other one. Generally, then, choice is free between readings of V and N. In practice, since N appears to be the more faulty one in detail, the

readings of V have been retained except where N furnishes a marked improvement on grammar, style, or sense.

The entries in the apparatus are positive, except such entries as "fit: sit N", meaning "fit: V; sit N", and "fit: sit V", meaning "fit: ego; sit V; def.N". The apparatus is meant to record all departures from V except for the notation of numbers, and for the places where banal dittographies have been eliminated, or self-corrections adopted. Where V has been followed, I have tried to cite those readings from N which concern larger omissions or additions, or lexical variants in nouns, verbs except the copula, adjectives, and adverbs derived from adjectives. Other variants, including those concerning word-order, declension, and mechanical continuation of verses quoted in full elsewhere, have been cited in selection.

The rubrics of V are printed in italics. The verses of Anianus have been printed according to V, with occasional corrections from those occurring separately in N and from a set found in Par.lat.7420A,26r-28r. All these corrections have been noted in the apparatus or by means of parentheses in the text; since they are virtually arbitrary, their sources have not been cited. The Cisiogianus (§35-46) is printed entirely from V, disregarding its two counterparts in N; the expansions given by V are in italics, and the feast-dates, in parentheses, are my additions.

§5. *Note on sources.*

I have not found any general source for the *Declar.* As could be expected, resemblances to the commoner *computi* are numerous; I here confine myself to repeating the observations from my earlier preface (1979a, p.II). The only computists cited are Gerlandus and Dionysius, in §16-17, concerning the solar cycles attributed to them. This passage is probably the cause of V's mention of Gerlandus in connexion with the Anianus-verses (§1, §87).

Parallels to our text may be found in Alexander de Villadei's *Massa Computi* ("MC", pages or verses from edition by Steele, 1926), in Sacrobosco's *Computus* ("S"), in Guil. Durandus' *Rationale*, book 8 ("D", chapters from the Venice edition of 1568), and elsewhere, as follows: §1: MC p.268,14 ff., D 1, §3. §1, "Augustinus": current in some form, cf. *Patr.Lat.*90,647, and the parallels in Wordsworth 1904,152. §2, etymology: common, cf. MC and D to §1 above. §13,

calculation: D 3, §17, cf. MC, v.270 ff.; verses, MC 247-8. §25: S. §28, verses "Sol erat": cf. MC 234-5, numbers different. §30-33: S. §48-49, golden number, etymology and story of Julius Caesar: common, e.g. D 11 ,§1, MC p.268,24 ff. §57,61,63,67-8: S. §82, verses: MC 146-7. §86: S; D 4,20-1, both of them with the "Augustine"-citation from *Decr. Grat.* 2,26,7,16. There does not seem to be any particular affinity to Balduinus de Mardocho's *Computus manualis* (manuscript, e.g., *Calendar, Pref.* §2b, ms.H,2v-10r; cf. O.Pedersen 1976 p.15).

Sigla testium.

V Venezia, B.Naz.Marc. 8,18 (=3573), IIr-XIv, A.D.1494

N Napoli, B. Naz. V.H.16, s.xv, 152r-163v

(1) *Incipit prooemium in computum metricum manualement secundum magistrum Gerlandum.*

Ut habetur circa primum De Anima, scientia est de bonis et de difficillimis, quod sic probatur. Cuius finis est bonus, ipsum quoque
 5 bonum est; finis scientiae est bonus; ergo scientia bona est. Quod finis scientiae sit bonus, probatur, quia per scientias ad virtutes, per virtutes ad beatitudinem pervenitur, beatitudo siquidem est status ex aggregatione perfectus omnium bonorum. Iterum probatur quod finis scientiae sit bonus, quia scientia ad deum finaliter ordinatur,
 10 qui est bonus; ergo scientia est bona. Quod deus sit bonus, dicit Algazel: "Deus est sine qualitate bonus, sine quantitate magnus, ubique praesens per essentiam, nusquam per singularem cohabitationem vel circumscriptionem." Apparet igitur ex praemissis quod scientia sit bona, cum ad deum, ut dictum est, finaliter ordinetur.
 15 Quattuor igitur, attestante beato Augustino, sunt necessaria in domo domini, scilicet grammatica, musica, canones, et computus: grammatica pro vocabulis exponendis, musica pro dei canticis modulandis, canones pro sacramentis fidei ordinandis, computus vero pro temporibus discernendis. Sed omissis aliis tribus ad computum accedamus.
 20

Sciendum est igitur quod duplex est computus, scilicet philosophicus et ecclesiasticus. Computus philosophicus est scientia infallibilis, secundum motum corporum superiorum tempora manifestans, et de isto nihil ad praesens. Computus ecclesiasticus est scientia

1 incipit--Gerlandum: *om.*N 3 bonis. .diff.: bono. .difficili N 10 qui est: et deus N dicit: *om.*N 11 Algazel: Algadel N 12 cohab. vel circ.: coartantiam(?) vel circumspectionem N 15 quattuor--domini: unde quanto magis et principaliter aliqua scientia ad deum finaliter ordinatur tanto est de numero aliorum. ista vero scientia de qua praesens est intentio ut dicit venerabilis doctor augustinus ad deum principaliter ordinatur nam eodem attestante quattuor scientiae sunt in domo domini necessariae N 19 discern.: N; disponendis vel d. 25 secundum usum ecclesiae temporis discretiva, et de isto praesens est
 intentio; quare iste libellus vocatur computus ecclesiasticus metricus
 et manualis.

(2) Istita ita praelibatis, quia causa est ad cuius esse sequitur aliud,
 scilicet effectus, ideo causam quadruplicem istius effectus vel operis
 30 inquiramus, scilicet quae sit causa materialis, finalis, efficiens et
 formalis. Causa materialis est tempus, quia de tempore in toto hoc
 opusculo pertractatur. Causa formalis est modus agendi et forma
 tractatus. Causa efficiens sive compilerator huius opusculi fuit magister
 Petrus de Dacia. Et licet plures fuerint qui de illa materia tractave-
 35 runt, tamen ille, quae ab aliis computistis diffusius tractabantur,
 artificialius et brevius compilavit, regulas computales ad quendam
 manualement modum applicando. Gerit enim practica vim formae
 scientiae declarativam, et ob hoc arti subiuncta est practica: nam
 ipsius artis necessitatem corroborat et discentis praecordia in tradita
 40 scientia certiorat. Causa finalis sive utilitas est, ut habito praedicto
 opusculo auditio memoriae commendetur et habeamus notitiam
 eorum, quae in ipsa scientia continentur, et per consequens facilio-
 rem aditum ad ipsam astrologiam, cui supponitur liber iste. Dicitur
 enim computus a 'computo, -tas', non quia doceat computare, sed
 45 quia computando docetur. His habitis ad litteram accedamus.

(3) *Incipit libellus eius cuius supra cum expositione Petri de Dacia.*

(4) Dividitur autem libellus iste in prooemium et tractatum. Secunda (5) incipit 'cyclus solaris', quae dividitur in quattuor partes, secundum quod sunt quattuor capitula huius libri. Partes autem partium et 55 partium particulae satis per rubricas apparebunt. In prooemio (3) breviter tria facit: primo ponit titulum sui libelli metrici, prout patet, secundo ostendit, in qua manu debeat ordinari, et tertio dividit opus suum in generali. Secunda ibi 'Laeva manus'; tertia ibi 'Quattuor in partes'. Sed ponamus alios versus, antequam ulterius procedatur, 60 usque ad illam partem 'Tu concurrentes domini' (23), quae alias dividetur.

(5) *Primum capitulum istius libri de cyclo solari et littera dominicali.*

Cyclus solaris septem quater occupat annos,
Ac in iuncturis totidem poni decet illos.
65 Hic expandatur iuncturis postea versus:
Filius Esto Dei Caelum Bonum Accipe Gratis.

(6) 'Filius' F signat, annum primum manifestat
Solis; et indicis hanc radix tenet; 'esto' dat E, quam
Vult medii radix, anni iunctura secundi;
70 Et sic de reliquis facias, velut ordo requirit.
Primo ponuntur radices, inde sequuntur
Iuncturae mediae, postea sunt reliquae.
Versu finito, tu sumas hunc iterato,
Donec in extrema parvi sistatur habena.
75 Solaque iuncturam deposcit dictio solam;
Omni iunctura parvi sit dictio bina
Propter bissextum, nam parvus denotat illum.
Fructus Alit Canos Et Gallica Bellica Danos
CamBit EDens GriFo BoAl DiCens FluEt AnGnus.

80 (7) Primo agit de cyclo solari in generali, secundo (15) in speciali.
Secunda ibi 'si forsán nescis'. Iterum prima in duas: primo agit de

52 libellus: liber N 55 rubricas: lubr. N 59 sed--procedatur: om. N

cyclo solari in generali, secundo (12) ponit quaedam notabilia de bissexto, ibi 'tunc bissextus erit'.

(8) Ad primam (5-6) sic proceditur: Cyclus solaris est spatium 28 annorum, a seipso incipiens et in seipsum finiens et revertens, et dicitur cyclus quasi circulus; nam quemadmodum, si vellemus circuire aliquod corpus sphaericum circumpunctatum 28 punctis, incipiendo ab uno puncto reverteremur ad idem, sic est in proposito. Nam incipiendo a primo anno cycli solaris et procedendo per 28 annos ad litteram dominicalem primi anni perveniam, et ita per 28 annos continue procedendo. Solaris etiam nominatur a sole, ut a causa digniori, quia nisi esset sol, non esset annus. Annus enim est spatium, in quo sol circuit et peragrat 12 signa zodiaci, et 28 anni huiusmodi complent et perficiunt istum cyclum. Vel dicitur solaris ad differentiam cycli lunaris, de quo inferius est dicendum. Si quaeratur, quare non sunt plures anni nec pauciores quam 28 in hoc cyclo, dicendum quod sunt 7 litterae feriales, scilicet A B C D E F G, quarum quaelibet potest esse, antequam totaliter compleatur cyclus, littera dominicalis 4 modis et 4 annis, scilicet primo anno post bissextum, in secundo et tertio et in anno bissextili; ad hoc quod quaelibet istarum litterarum septem possit esse littera dominicalis in 4 annis, requiruntur 28 anni, quibus cyclus iste perficitur et compleatur, quare et cetera. (9) Isti igitur 28 anni significantur per 28 iuncturas quattuor digitorum sinistrae manus, ita quod prima servit primo anno, secunda secundo, et sic deinceps est dicendum. Ad habendam igitur litteram dominicalem in quolibet anno cycli solaris sumatur iste versus, scilicet 'Filius Esto Dei', qui per primas litteras singularum dictionum nobis ostendit litteras dominicales, secundum quod in cyclo solari ordinantur; ita quod prima dictio, scilicet 'Filius', ordinetur in radice indicis ad significandum quod F est littera dominicalis in primo anno huius cycli; secunda, scilicet 'Esto', in radice medii; 'Dei' in radice medici; et sic de aliis dictionibus est dicendum secundum

forsanne N 82 secundo: 2^o N; 3^o V 83 ibi: et illa VN 84 proceditur: om.N 88 incipiendo: a primo anno cycli solaris procedendo per 28 annos add.N ex inferioribus 90 primi anni: N; om.V perveniam: devenerimus N 93 circuit: N; currit V 96 nec: etiam punctis add.N 97 feriales: N; sodales V d: om.V 99 littera: N; iste dicitur autem V 101 septem: om.N 103 significantur: N; -atur V 109 ordinantur: -atur VN 111 dei i.r.m.: om.N 114 addito: audito N 116 circumcissione:

ordinem iuncturarum, donec veniamus ad ultimam iuncturam parvi
 digiti, hoc addito, quod in qualibet iunctura parvi digiti duae
 115 dictiones sunt ponendae propter duplicem litteram dominicalem in
 anno bissextili existentem, quarum prima durat a circumcissione
 usque ad festum beati Matthiae apostoli, alia vero per totum annum
 residuum; sed in aliis annis non bissextilibus sufficit tantum una littera
 dominicalis. **(10)** Ratio autem, quare mutatur littera dominicalis in
 120 quolibet anno in principio Ianuarii, haec est, quia in principio
 kalendarium habemus A et in fine, ita quod de ultima die Decembris,
 quae significatur per A, venimus ad primam diem Ianuarii, quae per
 A similiter designatur; unde, si A in aliquo anno fuerit littera
 dominicalis, ultima dies Decembris erit dominica, et statim venimus
 125 ad primam diem Ianuarii, quae erit necessario dies lunae, modo ut,
 quasi A commutavit feriam suam, aliae similiter mutant ferias suas,
 ita quod G diem dominicam designabit. Et statim in alio anno iterum
 venimus de ultima die Decembris, scilicet die lunae, ad primam diem
 Ianuarii, scilicet diem Martis, ita quod ex consequenti F diem
 130 dominicam designabit. Et sic de annis ceteris est dicendum per retro-
 gradum ordinem litterarum, ut apparet in isto versiculo 'Filius Esto
 Dei'. Et in anno bissextili iterum mutatur littera dominicalis in loco
 bissexti vel paulo post, quia illa littera, scilicet F, in qua scribitur
 festum sancti Matthiae, duplicem feriam repraesentat, et ita in
 135 secunda acceptione mutat feriam, ad cuius mutationem mutatio
 sequitur aliarum. Et hoc est quod dicitur in hac parte.

(11) Tunc sequitur illa pars 'Tunc bissextus erit': quando anni
 domini possunt praecise per quattuor partes aequales per annos
 integros dividi, ita quod nihil remaneat, tunc est annus bissextilis.

140 **(12)** *De bissexto et loco eiusdem.*

Tunc bissextus erit, per partes quattuor aequas

Annos partiri cum poteris domini.

Bissextum sextae Martis tenuere Kalendae;

Posteriore die celebrantur festa Matthiae,
 145 Sabbata si fuerint ibi, non alibi celebrantur.

(13) Nota quod bissextus est excrescentia unius diei in 4 annis, et colligitur sic: Sol peragrans 12 signa zodiaci moratur in quolibet signo per 30 dies, per 30 trientes horarum et per 30 bisse momentorum. Et nota quod triens est tertia pars cuiuscumque rei divisae
 150 aequaliter in tres partes; remota vero tertia parte alicuius rei constantis ex tribus partibus, residuum dicitur bisse, unde bisse nihil aliud est nisi duo trientes. Nota etiam quod 40 momenta faciunt unam horam, et sic 30 bisse momentorum faciunt 20 momenta, quae 20 momenta faciunt horam dimidiam; et 30 trientes horarum constituunt decem horas, ut ex praedictis apparet; ita quod sol moratur in
 155 quolibet signo per 30 dies et 10 horas cum dimidia. Et sic moratur in 12 signis per 365 dies et per 6 horas, quae 6 horae in 4 annis constituunt unam diem naturalem, et illa dies intercipitur sexta kalendas Martii, et talis dies vocatur bissextus, et huius ratione totus annus
 160 dicitur bissextilis. Et quia illa dies provenit et causatur ex bisse momentorum, ut dictum est, ideo bissextus dicitur, vel quia una dies bis legitur in tali anno, ideo bissextus nominatur. Unde versus:

Est hic bissextus quia sit de bisse creatus
 Vel quia bis legitur, ideo bissextus habetur.

165 (14) Februarius dum haberet pauciores dies quam alii menses, diem habere meruit bissextilem, quare intercipitur in festo sancti Matthiae, ut signa signatis respondeant. Nam quemadmodum beatus Matthias non fuit principalis apostolus, immo vocatus ab aliis in sortem post dominicam passionem, similiter iste dies: non enim principaliter nec
 170 totaliter illo anno intercipitur, sed aliunde provenit et causatur, ut superius est expressum, quare et cetera. Et sciendum est, ut dicit

148 per₁: N; om.V

153 momentorum f. 20 m. q. 20 m.: om.N 155 ita quod: iam V; quod N moratur: N; mutatur V 156 et sic moratur: ergo N 158 intercipitur: N; interpretatur V sexta: sex N 161 bissextus: N; -tilis V vel: N; om.V 162 anno: sexto kl. martii add.N 163 hic: N; hinc V bissextus: N; om.V 166 quare: N; quia V .168 non: N; om.V aliis: apostolis add.N 169 passionem: N; -nis V enim pr.--illo anno: est pr.--de i.a. in quo N 173 duorum: dierum add.N 175-82 (§15): si forsan nescis N(lemma) 176 tu: ante quae V 178 demas: divinas V 184 sententia: N; sed causa V

textus, quod quando illa littera pro duobus diebus legitur, festum beati Matthiae in ipsorum duorum ultimo celebratur, quia a fine, tamquam a digniori, res denominatur.

175 **(15)** *Ad habendum quotus sit annus cycli solaris secundum Gerlandum.*

Si forsán nescis quae littera tu domini sit
 Et quotus est solis annus cognoscere quaeris,
 Annos a domini demas annis prius octo,
 Perque quater septem domini divideris annos;
 180 Dat quotus est solis annus quicquid remanebit,
 Et, si nil restat, tunc supremum fore constat.
 Octo bis ex centum remanent, ex mille viginti.

(16) Superius (5) dictum est de cyclo solari in generali, nunc autem agitur in speciali; ordo patet. Sententia huius partis talis est: Ad
 185 habendum quotus sit annus cycli solaris secundum Gerlandum, videlicet utrum primus vel secundus vel tertius et sic deinceps, attendendus est numerus annorum domini, et primo removendi sunt octo anni semel ab annis domini; deinde dividantur omnes anni residui per 28, quotienscumque poterimus; facta autem divisione aut
 190 aliquid remanebit aut nihil. Si aliquid remanserit, illud quod remanserit dabit nobis quotus sit annus cycli solaris; si vero nihil remanserit, erimus in ultimo anno, scilicet vicesimo octavo; computatione autem facta, de 28 nihil remanet. Ratio vero quare subtrahuntur 8 anni ab annis domini haec est, quia secundum Gerlandum transierant
 195 20 anni de isto cyclo, quando Christus natus fuit; unde ad perfectionem cycli, incipiendo a dicta nativitate, eiciendi 8 anni de annis domini.

(17) Nota etiam quod duo fuerunt computistae qui de isto cyclo tractaverunt diversimode, scilicet Gerlandus et Dionysius abbas. Et
 200 licet idem sit realiter, tamen melior est opinio Gerlandina, quia Dionysius incipit cyclum solarem ab anno bissextili, in quo habemus

186 et sic: N; sit V **188** semel: simul vel s. N **190** aut nihil--quod rem.: om. N **192** erimus: N; e. aut V anno: om. N **192-3** comput.(commut. V)--remanet: om. N **193** 28: 68 V **195** 20: N; octo V **196** incipiendo--eiciendi: iam incepti accipiendi sunt N **200** sit: faciant N

G et F pro litteris dominicalibus, et talis annus est duodecimus secundum Gerlandum; erravit siquidem Dionysius incipiendo cyclum ab anno bissextili, cum ante annum bissextilem tres anni debeant
 205 praecedere, ex quibus una cum quarto anno bissextus provenit et causatur; et sic posuit effectum ante causam. Gerlandus vero sic ordinavit cyclum, quod quartum annum posuit bissextilem. In hoc differunt isti duo, quod Gerlandus, ut visum est, removet octo annos in divisione annorum domini, Dionysius vero addit novem. Unde,
 210 habito quotus sit annus cycli solaris secundum Gerlandum, addantur anni XVII, et habebitur quotus sit secundum Dionysium; vel a cyclo Gerlandino subtrahantur XI anni, quod idem est, et habebitur cyclus Dionysii.

(18) Nota quod a creatione mundi usque ad adventum Christi
 215 fuerunt anni quinque milia centum et nonaginta novem, 5199, et ab origine usque ad annum Christi millesimum trecentimum vicesimum fuerunt anni 6619. Unde si nescieris numerum annorum domini, subtrahe annos, qui fuerunt a creatione mundi usque ad adventum Christi, de toto numero annorum mundi usque ad annum,
 220 de quo quaeris, et residuum erit numerus annorum domini. Unde versus de annis a creatione mundi usque ad adventum Christi:

Quingentos decies et bis centum minus uno
 Annos dic ab Adam, donec verbum caro factum est.

(19) *Quomodo debemus semper transire iuncturam radicalem.*
 225 Iuncturas transis quotiens numerum superaddis,
 Sed pro praeteritis tu retrograde numerabis.
 Annum radices excludit circulus omnis.

(20) Habito quotus sit annus cycli solaris pro anno praesenti, et per consequens quae sit littera dominicalis et in qua iunctura sit pro ipso
 230 anno praesenti et radicali, si volueris scire ad aliquod tempus praeteritum vel futurum annum cycli solaris et litteram dominicalem,

203 cyclum: solarem *add.*N 205 anno: ut dictum est *add.*N et: N; unde V 206 causatur: habetur VN vero: N; non V 207 cyclum: et [[m]]erito *add.*N in: N; et V 211 xvii: 42 V; 28 N 212 xi: v N 214-23 (§18): *om.*N 216 trecentessim--6619: *sic* V 219 annorum: *om.*V 221 annis a creatione: ante c-nem V 223 donec: do V 224-7 (§19): iuncturas transis N(*lemma*) 226 praeteritis: ceteris V 227 excludit: -tur V 230 et: N;

transi ad tot iuncturas, ad quot annos venire volueris, ita quod pro tempore praeterito ordine retrogrado, pro tempore vero futuro ordine progressivo – ita tamen quod iuncturam radicalem, id est
 235 iuncturam anni praesentis, teneas exclusive, illam non computando, et hoc quidem observandum est in quolibet cyclo, tam in decemnovennali quam in indictionali, iuxta illud 'annum radices etc.' –, et cum veneris ad iuncturam illius anni, de quo intendis, praeteriti vel futuri, expande istum versiculum 'Filius Esto Dei', et invenies
 240 litteram dominicalem, ut satis patet cuilibet subtiliter intuenti. Verumtamen si tu quaeras de maiori numero quam de 28, remove ab illo numero 28 quotienscumque poteris, et residuum ordina ante iuncturam in qua es, illa semper exclusa, ut superius dictum est.

(21) Vel aliter: si ille numerus, de quo quaeris, sit praecise divisibilis in 4 partes per annos dividendo, tunc quartam partem illius numeri ordina et computa in digito, in quo est iunctura, iunctura tamen radicali exclusa semper, ita quod pro tempore praeterito ordine retrogrado, pro tempore futuro ordine progressivo; et ubi per talem computationem in eodem digito factam quarta pars illius
 250 numeri terminabitur, in eadem iunctura per computationem 4 digitorum totalis numerus; et sic in quarta iunctura erit ad centum annos et in quinta ad mille. Unde versus

Quartaque iunctura dat centum, milleque quinta.

Si vero numerus non fuerit praecise divisibilis in 4 partes ut dictum
 255 est, sume maiorem numerum divisibilem in 4 partes contentum sub ipso numero de quo quaeris, et quartam partem ordina et computa in eodem digito, in quo es, ut dictum est, residuum autem ordina per processum aliorum digitorum secundum cycli ordinem. Totaliter procedendo usque ad iuncturam illius anni, de quo quaeris, habebis
 260 semper litteram dominicalem istum versiculum expandendo 'Filius Esto Dei'. (22) Poteris etiam habere septem litteras dominicales in

om. V 233 retrogrado: N; -de V 235 exclusive: -vam N 239 et: N; quod V 240 subtiliter: *om. N* 242 poteris: N; volueris V 243 iuncturam: vel post iuncturam *add. N* dictum est: est expressum N 245 annos: integros *add. N* 246 iunctura₂: *om. VN*
 251 numerus: terminatur *add. N* et: N; *om. V* 252 unde versus: *om. N* 254 ut dictum--partes: *om. N* 255 contentum: conceptum VN 257 es: est *Vp.c.* autem: N; vel V 259 usque: devento autem N 260 expandendo: exponendo N 261 septem l.d.--iuncturis: et l-am d-em et iuncturas N

septem iuncturis indicis per istum versiculum 'Fructus Alit Canos etc.'. Per eundem etiam versum habebis septem litteras dominicales medii digiti, incipiendo tamen ipsum in radice ipsius medii et
 265 dicendo per ordinem septem iuncturarum medii, incipiendo ab ista dictione 'Et Gallica Bellica etc.'. Iterum in medico habebis litteras dominicales per eundem versum, incipiendo ipsum ab ista dictione 'Danos', dicendo per ordinem iuncturarum medici. Duplicem vero litteram dominicalem habebis in qualibet iunctura parvi digiti per
 270 istum versum 'CamBit EDens etc.', ita quod duae primae litterae duarum syllabarum in qualibet iunctura parvi digiti in anno bissextili duplicem dominicalem litteram repraesentant.

(23) *De concurrentibus et regularibus ferialibus.*

Tu concurrentes domini per grammata nosces:
 275 A sex, B quinque, C quattuor, E duo, D tres,
 Primus concurrens F littera, septimus est G.
 Mensis cognosces regulares sic feriales:
 Quinque monos terni sex unus et inde quaterni
 Septem post bini quini septem tria seni.
 280 Dant feriam mensis concurrens et regularis.
 Si plus quam septem, reliquum cape, reice septem.
 Sunt in Marte novi concurrens et regularis.

(24) Ad sciendum quota feria quilibet mensis incipiat, duo numeri sunt inventi, scilicet concurrens et regularis ferialis. Concurrens est
 285 numerus variabilis datus anno, et dicitur concurrens quasi cum alio currens, scilicet cum regulari feriali. Quotus sit concurrens in quolibet anno, patet per hos versus 'A sex, B quinque etc.', quorum sententia talis est quod, quando habemus A pro littera dominicali, tunc habemus 6 pro concurrente, quando B, 5, et cetera, ut in littera
 290 satis patet. Concurrens in Martio renovatur et durat a Martio usque ad Martium.

263 habebis: N; *om.* V **264** medii₂: ab ista dictione *add.* N **265** incip. a.i.d.: *om.* N **266** et: N; *om.* V medico: N; medio V **270** cambit: N; cohere(n)s V ita quod: N; itaque V duae: die N **272** dominicalem: N; -cam V repraesentant: N; -tat V **273-82** (§23): *om.* N **277** mensis: menses V **283** ad sc.--mensis: *om.* N **286** feriali: f-arum N (*sic vel* f-ae *saepius*) **287** patet: apparet N **288** sententia: N; summus V **292**

(25) Regularis ferialis est numerus invariabilis datus mensi, et dicitur regularis a regula, eo quod est invariabilis sicut regula; tamen quilibet mensis habet suum regularem; et dicitur etiam ferialis, quia
 295 facit ad feriam cognoscendam. Quotus autem sit regularis ferialis cuiusque mensis, habetur per hos versus 'Quinque monos etc.'. In istis siquidem versibus sunt 12 dictiones numerales 12 mensibus servientes, prima Martio, secunda Aprili, tertia Maio et cetera; et sic habemus quod Martius habet 5 pro regulari feriali, Aprilis 1, Maius
 300 3, et cetera. Vel aliter: iunge regularem feriale[m] Martii cum diebus eiusdem, et a toto numero subtrahe 7 quotienscumque poteris; et residuum erit regularis Aprilis, et sic de aliis est dicendum. (26) Iunge ergo regularem feriale[m] mensis cum concurrente anni, et numerus inde proveniens dabit quota feria ille mensis incipiat, cuius regu-
 305 larem iunxeris concurrenti; unde si maior numerus proveniat ex tali additione quam 7, remove 7, residuum assumendo.

Vel aliter: vide quota feria designatur per tertiam diem mensis Martii, et totus est concurrens huius anni, incipiendo a Martio, quia Martius quantum ad constitutionem mundi fuit primus mensis; et
 310 dehinc habes hunc versum:

Concurrens totus F quota Martis erit.

(27) *De duodecim mensibus, et de diebus eorundem, quot quilibet habet.*

Annus solaris ex mensibus est duodenis:
 Ia Fe Mar Ap Ma Iu Iul Au Sep Oc No Dece.
 315 Iunius, Aprilis, September et ipse November
 Dant triginta dies, reliquis superadditur unus.
 De quorum numero Februarius excipiat,ur,
 Nam septem quater fertur habere dies;
 Sed cum bissextus fuerit, superadditur unus.

invariabilis: var. N 292-3 mensi--invar. sicut: om. N 294 suum: N; suam V 297 versibus: duobus v. N 298 maio: N; maii V 302 regularis (-are N *ut saepius*): r(alis V (*sic saepius*) 306 quam: N; quod V remove 7: om. N 307-11 vel aliter--martis erit: om. N 311 f: facit V 312-29 (§27-8): om. N 315 september: -bris V 326 meabat: -bit V

320 **(28)** *De duodecim signis zodiaci.*

Zodiacum signa totum claudunt duodena.
 Est Aries Taurus Gemini Cancer Leo Virgo
 Libraque Scorpsque Sagit Capricornus Aquarie Piscis.
 Semper quindenis scribuntur signa kalendis;
 325 Est Aries Marte, post ordine cetera pone.
 Sol erat octavo, bis nono luna meabat,
 Quando fuit Christus de sacra virgine natus.
 Solstitium decimo Christum praeit atque Iohannem.
 Aequa Crucis festum dant tempora Martis et Idus.

330 **(29)** *De divisione mensis cuiusque.*

Sex Maius Nonas October Iulius et Mars,
 Quattuor et reliqui, tenet Idus quilibet octo.
 Inde dies reliquos omnes dic esse Kalendas,
 Nomen sortiri debent a mense sequenti.
 335 Versibus his noscas mensis cuiusque Kalendas:
 Tantum Tendeat Quod Regem Summa Regebat
 Sanctus Rex Talis Sapienter Regna Subivit.
 Cum bissextus erit, unam Marti super addis.

(30) Diviso itaque anno solari in 12 menses et in dies mensibus
 340 resolutis, unicuique diei dederunt computistae propriam denomina-
 tionem, et hoc tripliciter. Prima dies mensis cuiusque dicitur Kalen-
 dae quasi colendae, quia in prima die cuiusque mensis fiebat festum
 Iunonis, quae secundum Ovidium uxor fuit Iovis, et interpretatur aer
 inferior. Vel dicuntur Kalendae a 'calo', quod est clamare vel vocare;
 345 nam praeco ascendebat pinnaculum templi et clamabat totiens 'kalo',
 quot erant dies quibus licebat homines liberos et immunes venire ad
 huiusmodi festum, in prima die mensis cuiuslibet celebrandum.

(31) Deinde post primum diem mensis sequuntur Nonae quasi
 nundinae, quia in illis vendebatur et emebatur; sed ultima dies dice-

328 iohannem: -nes V **330-8** (§29): sex maius etc. N(*lemma*) **335** noscas:
 nota V **338** cum: qui V erit unam marti: fuerit una martis V **340**
 propriam (-ia N): ipsam V **343** iunonis: N; nonis V **344** inferior: N; -ius
 V vel vocare: om.N calo: N; colo V **345** pinnac.: N; per pinnac.
 V totiens kalo q.e.d.: t.k. quotiens d. N; totius kale quod erat diebus V

350 batur principaliter Nonae, et alii dies inter Nonas et Kalendas denominantur a 'Nonas' cum numero, ut dicendo 'quarto Nonas', 'tertio Nonas', et cetera.

(32) Post Nonas vero sequuntur Idus, et dicuntur Idus ab 'iduo, iduas', quod est 'divido', quia in illis diebus nundinae dividebantur
355 et unusquisque ad propria remeabat. Quot Nonas quilibet mensis habeat, quot Idus, habetur per hos versus 'Sex Maius Nonas etc.'. Post Idus omnes aliae dies dicuntur Kalendae mensis sequentis et denominantur a prima die mensis sequentis cum numero, ut '19 Kalendas' et cetera, descendendo usque ad primam diem mensis.

360 (33) Nota etiam quod, licet bene dicamus 6. vel 5. Kalendas vel Nonas vel Idus talis mensis, tamen non bene dicitur '2^o Kalendas' et cetera, quia 'secundus' dicitur a 'sequor, sequeris', et talis dies non sequitur, sed praecedit; sed debemus dicere 'pridie Kalendas', id est primam diem ante Kalendas vel Nonas vel Idus. Ipsos autem tres dies
365 principales in quolibet mense sine numero proferamus ablativo casu, ut 'Kalendis, Nonis, Idibus' etc.

(34) *De kalendario manuali, qualiter ordinandum sit in sinistra manu.*

Postea de festis fixis sit regula talis:

370 A B C sunt extra, G supra, tres habent intra,
Radices dant D, dant E mediae, sed F trinae.
Mensis cuiusque coeptum versus dabit iste:
A-Dam De-Ge-Bat Er-Go Ci-Fox A-Dri-Fex.
Pro solo mense deservit syllaba quaeque.
Iuncturis istum sic debes ponere versum:

349 v-tur et e-tur: res v-ntur et e-ntur N dies dic.: dicitur N 350 alii d.:
N; aliis diebus V 350-2 denom.--tertio nonas: om.N 350 denominantur:
-atur V

352 et cetera: quot nonas--sex maius (l.355-6) hic habet N 354 divido: 'dis
add.N 355 remeabat (-bit N): quilibet mensis habet octo idus et denominan-
tur ab ultimo cum numero ut octavo idus septimo idus etc. add.N 355-6 quot
nonas--nonas etc.: om.N, cf. ad l.352 356 quot idus: om.N 357-8 et denom.
--sequentis: om.N 360 licet bene dic.: N; b. dicitur V 361 dicitur: dicitur
N et cetera: non() vel id() N 363 praecedit: quare et cetera add.
N debemus: N; om.V kalendas (kl() N): non() vel idus add.N 366 kal.
non. id. etc.: data kl() non() vel idus N 367-474 (§ 34-47): om.N 372 ci: a
V 374 istum--versum: tribus (cf. §60)--versus V 376 fox: fex V 377

375 Index A, medius Dam De Ge Bat, medicans Er
 Go Ci, Fox A parvus, indice pone Dri Fex.
 Anni pro festis sunt versus bis duodeni,
 Nam quivis mensis binos versus retinebit.
 Versus ponantur ubi mensis cui famulantur,
 380 Solaque iuncturam deponit syllaba solam.
 Demonstrat festa sanctorum syllaba prima;
 Expandas digitis versus ut hic ordo requirit:

- (47)** De inventione aurei numeri et q<?uousque> duret et ad quid valeat.
 470 Ignorans numerum qui lunae praedicat ortum,
 Per denos nonos Domini diviseris annos,

442 iunctis: ex iacinct(i)? V
 458-9 ce,cle,cri (Nov.22-4): te, de,gri V 469-74 (§47): om.N 471 nonos:
 nouos V 472 notat: denotat V 475 inveniendum: N; aureum numerum

Adiungens unum; quicquid superest, notat illum,
 Et si nil restat, decimum nonum fore constat.
 Dant centum quinque; duodenos dant tibi mille.

- 475 **(48)** Ad inveniendum primam lunam in calendario quidam numerus est positus et signatus, qui dicitur numerus aureus, quia sicut aurum praecellit alia metalla, ita iste numerus inter alios numeros subtilior reperitur; vel dicitur aureus, quia antiquitus litteris aureis scribebatur. Iste igitur numerus durat per 19 annos, ita quod in primo anno
 480 habemus 1 pro numero aureo, in secundo 2, et sic consequenter usque ad 19. Postea revertimur ad 1, procedendo semper per 19 annos, et ideo iste processus dicitur cyclus decemnovennalis. Si igitur vis scire, quotus sit numerus aureus et quotus annus cycli 19^{lis}, adde unum annum annis domini, et deinde divide totum per 19 quotiens-
 485 cumque poteris, et quicquid ultra remanserit erit aureus numerus; et si nihil remanserit, tunc erit in 19^o anno. **(49)** Quare autem iste cyclus non habet plures vel pauciores annos quam 19, haec est causa, quia ille qui aureum numerum adinvenit, et dicitur quod fuerit Iulius Caesar, in primo anno suae dominationis ubicumque invenit primam
 490 lunam in quolibet mense posuit 1, in secundo 2, in tertio 3, et cetera usque ad 19. In 20^o vero anno invenit primam lunam in quolibet mense ubi posuerat 1, in 21^o, ubi posuerat 2. Invento igitur numero aureo alicuius anni, ubicumque in quolibet mense per totum annum ipsum inveneris, eadem die dic lunam esse primam, et sic secundum
 495 kalendarium ecclesiasticum; et tamen quando dicitur prima secundum ecclesiam, iam est tertia vel quarta secundum naturam, ut inferius apparebit.

add.V calendario: ecclesiastico *add.N* **477** inter alios numeros subtilior: N; subtiliter V **480** et sic consequenter: in 3^o 3 etc. N **483** cycli 19^{lis}: xix^{alis} N; *om.V* **486** 19^o anno: b (?) *add.V*; nota quod quando dominus natus fuit de isto cyclo transiērat unus annus et ideo additur unus annus annis domini per 19 dividendo *add.N* **488** aureum: *om.N* et dicitur...caesar: N; dicitur...caesar qui V fuerit: *om.N* **489** dominationis: indaginis N; considerationis *Guilelmus (Harper p.109)* **490** lunam: N; litteram V **491** 20^o: vicesimo N; 2^o V lunam: N; litteram V **492** in 21^o: et secundam N posuerat 2: et sic deinceps est dicendum quare etc. *add.N* **494** inveneris invenies *Va.c.* **496** ecclesiam: N; -asticum V quarta: N; q. die V **497** apparebit (*nusquam*,

(50) *De ordinatione aurei numeri in digito sinistrae manus.*

Addit lunaris tres cum decimo novenalis;
 500 Denis nonisque completur cyclus uterque.
 Aureus hinc numerus est versibus his manifestus:
 Ternus undin nod octo sexd quinque tred ambo decem dod
 Septem quin quartus duc iota novem dep ui quod.

(51) *In qua iunctura incipiat quilibet mensis.*

505 In digitis quinque numerus situabitur iste:
 'Ter' parvi bina, 'nus' trina dat, 'und' tibi summa,
 'Din' tibi dat quinta, 'nod' sexta, dat 'oc'que suprema,
 'To' dat pol media, 'sexd' ra pol, 'quin' dabit in ra.
 In totum comple, medium, medicum superadde;
 510 Ra parvi finit numerum, quia 'quod' retinebit.

(52) In istis duobus versibus praedictis sunt 19 dictiones aureum numerum designantes, secundum quod in calendario ordinatur, quarum aliquae sunt bisyllabae et aliquae monosyllabae: quaeque bisyllaba denotat numerum cum spatio subsequenti, monosyllaba vero solum numerum repraesentat. Sunt autem in istis versibus 30
 515 syllabae, et debent ordinari in 30 iuncturis, ut patet in textu, incipiendo in secunda parvi digiti, ponendo 'ter', in tertia 'nus', in summitate 'un', in quinta 'din', in sexta 'nod', in ultima 'oc', in media pollicis 'to', in radice eiusdem 'sexd', in radice indicis 'quin', in
 520 secunda 'que', et sic deinceps, donec ultima syllaba, scilicet 'quod', in radice parvi digiti ordinetur, etc.

(53) Taliter incipies iuncturis postea menses:

Bina Ia Mar, Feb A terna, Ma summaque, Iunius extra,

525 Post Iul, Au suprema, Sep Oc ra pol, in No De post ra.
 Iuncturis primam si vis inquirere lunam,
 expandas digitis versus ut hic ordo requirit:
 Cisio etc.

(54) Ianuarius, ut textus docet, et Martius incipiendus est in secunda
 iunctura parvi digiti, Februarius et Aprilis in tertia, Maius in
 530 summitate, Iunius in quinta, Iulius in sexta, Augustus in ultima;
 September et October in radice pollicis, November et December in
 secunda indicis; quibus mensibus taliter ordinatis et inceptis si vis
 scire quoto die alicuius mensis luna sit prima secundum kalenda-
 rium, expande in iuncturis duos versus de 'Cisio' deservientes ipsi
 535 mensi, incipiendo ipsos in iunctura, procedendo per ordinem iunc-
 turarum in quibus ordinantur isti versus 'Ternus undin etc.'; et
 quaecumque syllaba tetigerit iuncturam illius anni numerum aureum
 designantem signat lunam primam in die cuiusque dicitur syllaba
 deservire.

540 (55) Maiori numero debetur tertius ordo,
 Cumque minor sequitur, maiori continuatur;
 Sed facienda locis instantia sit duodenis:
 Mensibus in paribus sex sunt, dicit tibi versus:
 Sic faciet saltum 'bla si in steph o bar' addo,
 545 Sex aliae resident in sex, factae prope finem:
 'Un nod din' ponet tibi Iulius atque sequentes.
 Octo Feb terna, duo dent Augusque December,
 Iunius est quatae, sextae donetur Aprilis
 Octo Decemberque November Iul Au Sep fine tenetur.

550 (56) Hic ponitur regula bimembris, scilicet de situatione aurei
 numeri in calendario, et regula de se patet. Ab ista autem regula
 sequuntur 12 exceptiones, quae instantiae nominantur, quarum sex

528 ut textus d.e.m.inc. est: et mars N 531 september, oct-er, nov-er, dec-er:

 551 et regula: r(ubri)ca N patet: in littera add.N 552 exceptiones: N;

sunt in mensibus paribus circa principia eorundem. Menses autem pares sunt illi qui faciunt numerum parem inter alios menses, et sunt
 555 secundus, quartus, sextus, octavus, decimus duodecimusque, scilicet Februarius, Aprilis, Iunius, Augustus, October, December; et alii sex dicuntur impares. Quilibet igitur de paribus habet unam instantiam circa principium suum, ita quod Februarii tertia die evenit instantia, eo videlicet quod ibidem ordinantur 19 post XI in secundo loco,
 560 nullo spatio mediante, quod est contra regulam 'maiori numero etc.'. Alia instantia evenit sexta die Aprilis, alia quarta die Iunii, alia secunda die Augusti, et isti tres proveniunt et causantur ex eo videlicet, quod in locis praedictis ponitur iste numerus 16 immediate post 8, quod est contra istam regulam 'maiori numero etc.' Alia
 565 instantia evenit tertia die Octobris, quod habet scribi iste numerus 13 immediate post 5, quod similiter est contra regulam. Et alia instantia est secunda die Decembris, eo quod hic in eadem linea scribuntur duo numeri, scilicet 13 et 2, et est contra regulam, quia iste numerus 2 debet scribi in sequenti linea et scribitur in eadem.
 570 Sed hoc fit quia, quando habemus 2 pro aureo numero, hic incipit primus embolismus, et cum lunatio embolismalis habeat 30 dies, ideo iste numerus 2 hic antecipatur per unum diem, quia aliter non esset illa lunatio 30 dierum.

(57) Vel aliter: menses pares habent lunationes impares, scilicet 29
 575 dierum, et menses impares habent lunationes pares, scilicet 30 dierum, et sic secundum kalendarium ecclesiasticum, quia, licet omnes lunationes secundum naturam habeant dies 29 cum dimidia, cum non posset frangere litteram feriale, ordinavit quod menses impares haberent lunationes pares, ut dictum est. Et sic lunatio 30 dierum
 580 recompensat dimidiam diem alterius, et sic apparet quod pro quolibet mense impare sunt 30 iuncturae necessariae, sed pro mensibus

extensiones V 557 ig. de paribus: mensis par N 558 feb-ii: N; -ius V 559 xi: ij N 560 regulam: praedictam *add.*N 564-6 alia inst. evenit --contra regulam: N; *om.*V 565 habet scribi: h. scribere N; *def.*V 567 est secunda (2^a V): evenit 4^a N linea: littera et l. VN 568 2 et est: 22 est igitur hoc N 569 iste: N; isti V 2 debet scribi: N; d. inscribi V linea: littera V; l. vel littera N eadem: N; eodem V 570 fit: N; *om.*V 575 menses: habent *add.*N 577 cum di-a: et di-am diem N 578 frangere: N; transiret V 579 ut dictum est: scilicet xxx dierum et pares menses haberent impares scilicet 29 dierum N 580 alterius: N; alteram V 582 primam: in manu *add.*N

paribus 29 sufficiunt. **(58)** Unde quando quaerimus lunam primam per istos versus 'Cisio ianus', debemus transire unam iuncturam in quolibet mense pari et illam minime computare; ubi autem
 585 fiat saltus, apparet per istas sex syllabas 'bla si in steph o bar': per 'bla' intellegimus diem tertium Februarii, per 'si' sextum Aprilis, per 'in' quartum Iunii, per 'steph' secundum Augusti, per 'o' tertium Octobris, per 'bar' quartum Decembris, quia in istis locis sunt instantiae. In faciendo saltum corriguntur in manu, et hoc fit ut
 590 magis possit calendario uniformiter respondere.

(59) Aliae sex instantiae sunt in sex mensibus ultimis, scilicet circa finem Iulii Augusti Sept Oct, circa finem No Decem: quilibet illorum habet unam instantiam circa finem. Istaе autem sex instantiae
 595 neque locus vacuus, et inter 19 et 8 spatium ordinatur, quod est contra utrumque membrum regulae praelibatae, scilicet 'maiori numero etc.'. Ideo in manu debemus ponere pro istis sex mensibus immediate post 11 19 et ponere spatium inter 19 et 8, quod sic fiet, si ubi dicimus 'din', dicamus 'nod' dicendo 'ternus und nod din'.

600 **(60)** *De epactis et regularibus lunaribus.*

Per tres iuncturas pollex formabit epactas:
 Iuncturis tribus his auri numerum situabis,
 Deme unum, post adde novem, post undeviginti,
 Et si triginta superant, triginta moveto.

605 Mensis lunares sic scire potes regulares:
 Quinque Sep Oc dantur, No De septem, ter tria Ia Mar,
 Ap Fe decem sumat, post unum cuilibet addam.

610 Horum triginta, triginta tollere cura.
Mars concurrentes renovat, September epactas.

(61) Ad habendum secundum kalendarium ecclesiasticum, quota sit luna in prima die mensis cuiusque, duo numeri sunt inventi, scilicet epacta et regularis lunaris. Epacta est numerus variabilis datus anno, et dicitur ab 'epi', quod est 'supra', et 'thesis', quod est 'positio', quasi numerus suprapositus, scilicet supra regularem lunarem; quem numerum, scilicet epactam, invenies in quolibet anno cycli decemnovennalis in tribus iuncturis pollicis numerando, scilicet incipiendo in summitate, in qua ordinabitur primus annus cycli decemnovennalis, secundus in media, tertius in radice, iterum revertendo ad summitatem, et sic per ordinem iuncturarum totus cyclus expleatur et in summitate pollicis finiatur. Si vero annus, cuius epactam quaeris per istam ordinationem, in summitate inveniatur, remove 1, si in media, adde 9, si in radice, adde 19, et totum erit epacta; sed si maior numerus proveniat ex tali ordinatione quam 30, tolle 30, et residuum erit epacta. Et sic apparet quod in primo anno cycli decemnovennalis epacta est nulla, in secundo 11, in tertio 22, in quarto 3, et cetera. (62) Vel aliter, in primo anno epacta est nulla, cui si addideris undecim, habebis epactam secundi anni, scilicet undecim; cui si addideris 11, habebis epactam tertii anni, scilicet 22, et sic semper addendo 11 procedas. Si autem maior numerus proveniat quam 30, proice 30, et residuum erit epacta. Nota etiam quod in primo anno epacta est nulla, quare tunc sufficiunt mensium regulares. Nota etiam quod quantum ad epactas et embolismos incipimus in Septembri, quia Arabii, qui istos numeros invenerunt, annum inceperunt in Septembri.

ta: N; quoto V 614 lunaris: om. N 617 numerum sc. epactam: N; n-us sc. ep-us V anno: anni V; anno per annos N 618 numerando sc.: numerandos VN 619 qua: N; quo V 620 revertendo ad sum-tem: iiii in sum-te N 621 et sic p.o.i.: etc. p.o.i. donec N 622 epactam: N; -ta V 623 si in--9: N; om. (66) *De clavibus festorum mobilium.*

- 665 Per clavis numerum cognosces mobile festum.
 Tunc auri numerum numerant summae digitorum:
 Vicenos quinos, tredecim, plus asse tricenos,
 Undeviginti, epta, digitis pro clavibus apta.
 Si quadraginta superant, triginta moveto:
 670 Sit numerus clavis illud tibi quod remanebit;
 Pro sep et quadra bissexte diem superaddas.
 Incipientque dies clavem numerare sequentes:
 G Iani prima, post ultima, Gque <secunda
 Martis, et Aprilis G tertia Gque> suprema.
 675 Post clavis numerum Domini lux dat tibi festum;
 Si cadat in lucem Domini, suppose sequentem.
 Terminus et festum numquam celebrantur ibidem.

- (67)** Ad habendum quinque festa mobilia quidam numerus est inventus, qui dicitur clavis terminorum quia, sicut per clavim domus
 680 ingredimur sive portas, ita per istum numerum in festorum mobilium notitiam devenimus. Sunt autem festa mobilia quinque, scilicet septuagesima, quadragesima, pascha, rogationes et pentecoste. Si vis igitur scire quota sit clavis in aliquo anno, computa numerum aureum totius cycli decemnovennalis in summitatibus quinque digi-
 685 torum, incipiendo a summitate pollicis per ordinem donec invenias numerum aureum istius anni, in quo quaeris clavem, in summitate alicuius digiti. Si vero inveneris ipsum in summitate pollicis, adde 25, et totum erit clavis; si in indice, tredecim; si in medio, 31; si in medico, 19; si in parvo, 7. Tamen si maior numerus provenierit
 690 quam 40, tolle 30, et residuum erit clavis. **(68)** Inventa igitur clave alicuius anni, computa tot dies, quota est clavis, pro quolibet festo mobili, incipiendo pro septuagesima in prima G Ianuarii, pro qua-

octavus et xi post ternus dicimus(!) sextus decimus et decanonus *add.N* **664-77**
 (§66): per clavis numerum etc. *N(lemma)* **665** per: et V **666** numerant: -rat
 V **667** tricenos: picens V **669** superant: -rat V **670** sit: si V
671 superaddas: s(un)t addas V **679** clavis: N; aquis V clavim: N; clavos
 V **680** ingredimur: N; -itur V sive portas: *om.N* **682** rogationes: N;
 -num V pentecoste (N; -tes V): nota quod dominica ante ascensionem domini
 dicuntur rogationes *add.N* **685** invenias: -amus VN **686** in summitate: N;
om.V **687** inveneris: non inv. VN **688** totum: N; tantum V **689** me-

dragesima in ultima G, pro pascha in secunda G Martii, pro rogationibus in tertia G Aprilis, pro pentecoste in ultima G Aprilis, quia per
695 ista quinque habemus sedes festorum mobilium. Computa ergo a sede clavis tot dies, quota est clavis, et post terminum talis computationis sequenti dominica festum mobile celebretur. Verumtamen si clavis terminetur in die dominica, non in illa die, sed in sequenti festum mobile celebretur.

700 **(69)** *Sequuntur versus ad inveniendum festa mobilia.*

Postea mobiliá si vis cognoscere festa,
Sep quadra pascha ro pen 'pris sti ne ci que' dato sedem;
Sedem festorum radix tenet indicis horum.
Aureus hinc numerus iuncturis inveniatur,
705 Dat tibi post numerum domini lux mobile festum.
Doc Ianus, octo Febris, bis undin Mar, bis
Tres decem A, <decem Mai. . .>

(70) Si vis invenire festa mobilia per regulas manuales, ordina litteras feriales, quae sunt A B C D E F G, in quinque digitis, scilicet in
710 quattuor sinistrae manus et in parvo dextrae manus, quia licet sufficiant 4 digiti pro festis fixis, tamen pro festis mobilibus sunt 5 necessarii. Ordinabuntur igitur ipsae litterae per illas scilicet regulas 'A B C extra etc.', et tunc quaere iuncturam significantem aureum numerum illius anni, quo invento ordina istas quinque syllabas in
715 radice indicis, scilicet 'pris sti ne ci que'; quibus quinque syllabis sic in radice indicis situatis, expandantur isti versus 'Ci octave' per ordinem singulorum digitorum, incipiendo pro septuagesima ab ista syllaba 'pris', dicendo 'Prisca Fab Ang Vin Cen etc.', donec invenias

dico: N; medio V 19: 29 N **693** ultima g: ult. N rogationibus: N; -num V **694** pentecoste: -sten V; pent() N g aprilis: om. N **695** quinque: g add. N sedes: quinque add. N **696** comput.: N; deput. V **698** illa die: illo N **700-7** (§69): postea mobilia etc. N(*lemma*)

702 quadra, pen, ci: quad, pentecosten, a V **705** domini: om. V **706** doc: docet V **707** a: ma V et add. [[igitur ipsae litterae per illas]] ex inferioribus **709** quae sunt: vii scilicet add. N g: N; g h V **711** tamen pro--necessarii (-ric N): N; om. V **713** significantem: signantem V; -cationem N **714** quo invento: qua i-a N **715-6** scilicet pris--indicis: om. N **715** ne ci: me a V **716** ci octave: cisio ianus etc. N **717** incipiendo: N; incipe et da V **718** pris: prius N vin cen: vim can V; om. N **719** dominicalem: N; -cam V

720 iuncturam dominicalem primam post numerum aureum existentem;
 et quaecumque syllaba tetigerit ipsam iuncturam dominicalem pri-
 mam post numerum aureum existentem, signat septuagesimam
 celebrari in die cui dicitur ipsa syllaba deservire. Et sic de aliis est
 dicendum, incipiendo pro quadragesima ab ista syllaba 'sti', pro
 pascha ab illa 'ne', pro rogationibus ab illa 'ci', pro pente ab illa
 725 'que'. Unde, si habemus numerum aureum 16 et litteram domina-
 calem D, tunc festa mobilia praecise celebrantur in diebus, quibus
 deserviunt istae quinque syllabae supradictae, etc.

(71) *Hebdomadae a nativitate domini usque ad quinque festa mobilia.*

730 Hebdomadas a nat pro festis indicis A dat
 Quattuor hinc, septem, tredecim, decem octo, viginti.
 Quaevis tacta dehinc iunctura diem superaddit;
 A dabit hebdomadam; tamen indicis A nisi tangam,
 Citra quaeque vacans iunctura diem movet unam.

(72) Computa in A indicis 4 hebdomadas a nativitate usque ad
 735 septuagesimam, 7 usque ad quadragesimam, 13 usque ad pascha, 18
 usque ad rogationes, 20 usque ad pentecosten. Si vero iunctura
 dominicalis post numerum aureum propinquior esset ultra A indicis,
 tunc pro qualibet iunctura existente ab A indicis usque in iuncturam
 dominicalem primam post aureum numerum addetur una dies ipsis
 740 hebdomadis in A indicis computatis, et pro qualibet A una hebdo-
 mada, quia ab A usque ad A est hebdomada numeranda. Sed si
 iunctura dominicalis propinquior post numerum aureum esset ante A
 indicis, tunc pro qualibet iunctura vacante removetur una dies.

(73) *Hebdomadae a pentecoste usque ad festum sancti Iohannis baptistae.*

745 A pente festis sic distant festa Iohannis:
 Indicis hebdomadas G sex dat, et altera tollit:
 Ultra vel citra dic ut supra vice versa.

721 signat: significat N septuag.: semper N 723 quadrag.: septuag.
 N sti: bru N 724 illa ne: ista syllaba ne N rogationibus: N; -num
 V ci: a V; co N pro pente a.i.q.: om.N 725 16: xij V; xv N 726
 celebrantur: -arentur N 727 deserv.: serv. N 728-65 (§71-6): om.N
 729 a dat: addat V 730 decem: om.V 731 quaevis: quae nisi V 732
 a₂: om.V 733 iunctura: -ram V 734 4: viginti add.V 735 ad₁: om.V
 736 rogationes: -num V iunctura: littera V 737 ultra a: ultima V

(74) A pente festis computa in G indicis 6 hebdomadas usque ad festum sancti Iohannis baptistae. Si vero iunctura dominicalis prima post numerum aureum sit ultra G indicis, pro qualibet iunctura ultra existente usque in ipsam iuncturam dominicalem removeatur una dies, et pro qualibet G una hebdomada; sed si ipsa iunctura dominicalis sit ante G indicis, tunc pro qualibet iunctura vacante addatur una dies.

755 (75) *Hebdomadae a pentecoste usque ad adventum.*

A pente distat adventus et undetriginta
 Hebdo dat indicis A, B tollit quaelibet unam.
 Andreae festo vicinior ordine quovis
 Adventum domini prima colit feria;

760 Si cadat in lucem domini, celebratur ibidem.

(76) Computa in A indicis 29 hebdomadas, et si iunctura dominicalis prima post numerum aureum sit ultra A indicis, tunc pro qualibet B ab A indicis usque ad ipsam iuncturam dominicalem existentem remove unam hebdomadam ab ipsis 29 hebdomadis in A indicis computatis.

(77) *De inventione litterarum tabularium alphabeti.*

Noscere si quaeris quae littera sit tabularis,
 Alphabeti duo debes cognoscere primo:
 B post-punct primum, sed A pre-punct esto secundum,
 Vel primae nigrae fiant, rubeaeque secundae.
 Primum finit in U, reliquum se terminat in Q.
 Indicis incipiet ra primum, sexta secundum
 Incipiet medici; post aurum tangere lucem
 Quae domini poterit, haec littera sit tabularis.

775 (78) Videntes computistae quod festa mobilia poterant celebrari in 35 diebus, iuxta illud ordinaverunt 35 litteras tabulares, quibus tabulas

738 usque in: v(idelicet) V 740 qualibet a: q. /n/ V 744 pentecoste: -ten V

depinxerunt. Et ordinaverunt duo alphabeta: primum incipit per B
 et finitur in U, cuius litterae sunt postpunctatae, secundum incipit per
 A et finitur in Q, cuius litterae sunt praepunctatae. Si ergo vis scire
 780 quae littera sit tabularis in aliquo anno, incipe primum alphabetum a
 radice indicis et procede per ordinem iuncturarum litteras expan-
 dendo. Et si non sufficiat primum, incipe secundum in sexta iunctura
 medici et fac ut prius; et quaecumque littera poterit tangere iunc-
 turam dominicalem primam post aureum numerum, dicatur littera
 785 tabularis. Et sic poteris verificare tabulas et probare.

(79) *Hebdomadae a nativitate domini usque ad quadragesimam.*

B sex hebdomadas, F septenas dat, N octo,
 Uque novem, G secunda decem, quibus O dedit unam.
 Addidit hebdomadis B dies tres initiales,
 790 Littera quaeque sequens praemissis addidit unam.
 Anno bissexti vult una dies superaddi.

(80) Nota quod, quando B primi alphabeti est littera tabularis, tunc
 sunt computandae sex hebdomadae et tres dies a nativitate domini
 usque ad quadragesimam, et quando F 7, quando N 8, quando U 9,
 795 quando G secundi alphabeti 10, quando Q 11 et dies 2; et anno
 bissextili vult una dies superaddi.

(81) *Sequitur de cyclo indictionali.*

Si per quindenos domini diviseris annos,
 His tres adiungens, indictio sit tibi praesens.
 800 Dum redit October, indictio sit nova semper,
 Quattuor atque tribus illi praelata diebus.

(82) Indictio sive cyclos indictionalis est spatium 15 annorum conti-
 nens 3 lustra, id est 3 quinquennia. Nam cum Romani subiugassent
 totum mundum, edictum fecerunt quod in quolibet quinquennio

finitur: terminatur N postpunctatae: N; -ctae V **778-9** secundum--prae-
 punct.: om.N **779** praepunctatae: -ctae V **781** expandendo: N; exponendo

 N(*lemma*)

805 venirent homines de diversis nationibus Romam tributa imperatoria
deferentes, et ordinaverunt tria tributa, scilicet aes, argentum et
aurum, unde versus:

Roma tributa dari sibi per quinquennia iussit,
Aes prius, argentum post hoc indixit et aurum.

810 Si igitur vis scire, quota sit indictio omni anno, divide annos domini
in numerum quindenarium, semper proiciendo 15, et illud quod
superfuerit erit indictio, adiunctis tribus simul annis ad annos
domini. Si vero praecise diviseris eos in 15, singulis computatis, tunc
erit quintus decimus annus indictio. Remanent autem computando
815 de 100 10 et de 1000 100; computa et invenies; et sic computatione
facta de mille cccc^{tis} lxxxii nihil remanet.

(83) *Quomodo annus dividitur in quattuor partes temporis.*

Ver Petro detur, aestas exinde sequetur,
Hanc dabit Urbanus, autumnum Symphorianus,
820 Festum Clementis hiemis caput est orientis.

(84) Nota quod annus dividitur in 4 partes, scilicet in verem, aesta-
tem, autumnum et hiemem; ubi vero incipiunt, in littera satis patet.
Ver est humidus et calidus, cui correspondet sanguis; aestas est calida
et sicca, cui cholera correspondet; autumnus est frigidus et siccus, cui
825 correspondet melancholia; hiems est frigida et humida, cui cor-
respondet phlegma.

(85) *De vigiliis sanctorum et de ieiuniis quattuor temporum quomodo inveni-
untur.*

Nat mat penthe io pe iac lau sumptio barto
830 Simon et omne math an thomas triduum quadragna.
Dant crux, lucia, cineres, carismata dia
Quod fit in angaria quarta sequens feria.
Nobis ecclesia ieiunia praecipit ista.

(86) Inde dies aegros per versus noveris istos:
 835 AuGurio DeCies AuDito LuMine ClanGor
 <LinQuit OLens ABies CoLuit CoLus EsCula GaLus
 Omnibus in reliquis, sed non hic H numeratur.>

(87) In anno sunt 24 dies, qui secundum antiquos dicti fuerunt dies
 aegri, id est mali, abominati et infelices propter malas aliquas
 840 constellationes, ut dicebant. Referebant namque quod in illis diebus
 non erat bonum incipere aliquod opus vel negotiationem, et quod si
 quis in aliquo ipsorum aegrotare inciperet, vix aut numquam respi-
 raret, et hoc habebant in sorte. Sed hoc non est credendum, quia
 sancta ecclesia prohibet carminibus et sortilegiis fidem dare. Dicuntur
 845 etiam Aegyptiaci, quia in illis diebus missae sunt plagae super
 Aegyptios, scilicet 24, quarum 10 fuerunt principales et 14 non ita
 principales. Dicuntur etiam vetiti sive prohibiti quantum ad phlebo-
 tomiam faciendam propter quandam haeresim evitandam; nam anti-
 quitus Romani in illis diebus sibi faciebant minui, ut sanguinem
 850 suum sacrificarent Plutoni, qui Pluto secundum fabulas dicitur deus
 terrae inferni et divitiarum, et sic faciebant ut in divitiis abundarent;
 unde in principio fidei nostrae inhibuerunt sancti patres phleboto-
 miam propter huiusmodi haeresim evitandam, unde dicit beatus
 Augustinus quod Kalendae et dies Aegyptiaci non sunt obser-
 855 vandae.

Et sic est finis praesentis operis.

*Explicit computus metricus manualis secundum Gerlandum cum declaratione
 magistri Petri de Dacia, copiatu per me magistrum Nicolaum de Ripis Venetum
 1494.*

Demonstrationes
magistri Petri (?) Dace
super quadrantem

Frater Petrus Inguari
studens Roskildensis

DEMONSTRATIONES MAGISTRI PETRI (?)DACE
SUPER QUADRANTEM.

Hessische Landes- und Hochschulbibliothek 780. 21½×15½, ff.311, written about 1465 in Sulzbach in the Oberpfalz (Bischoff, below), containing miscellaneous astronomical texts. The manuscript was first described in detail by B.Bischoff ("Neuaufgefundene Auszüge aus einem verschollenen Katalog der Amploniana", München 1934, reprinted with one correction in *Mittelalterliche Studien* I, 1966, 133-40).

The present text (T&K 35) is at ff.245v-246v, preceded by some short texts on measuring ("De declinatione solis per quadrantem", "Ad mensurandum cum virga, cum speculo"), and followed by one "de virga visoria" partly in German (titles from Bischoff). Of these I have only seen the text last mentioned, and cannot determine whether our text was intended to illustrate the others.

As it appears, only banal use is made of the Quadrant, such as may fit the Old Quadrant as well as any other type; thus, in the few references to be cited, I have kept to Tannery's edition of that work (1922). O.Pedersen (1976,47) notes the textual dissimilarity to the treatise(s) on the New Quadrant (cf. *Intr.* §11a; the passages in question largely coincide with those on the Old Quadrant) and disbelieves in the ascription to Peter of Dacia. With the present state of evidence the matter should be left at that.

Some instances of "(et)" miswritten for "2" and "est" for "3" have been emended tacitly.

(Hdg.): Demonstrationes magistri Petri Dace super quadrantem.

(Txt:) Ad demonstrandum rerum altitudines, procedendo in omni consideratione, qua per instrumentum quis altitudinem rei mensurandae prospicit, ex re erecta mensuranda et ex radio visuali et ex plano unus magnus triangulus constituitur. Radius autem visualis in continuum duci imaginatur usque dum angulum faciat in contac-

tum sui cum plano. Item et in hoc triangulo est quidam triangulus partialis, qui componitur ex altitudine oculi considerantis et ex duabus partibus, scilicet plani et radii visualis, quarum una est ab oculo ad punctum contactus, sicut hic patet:

Sit enim linea AB res mensuranda, linea DE elevatio oculi considerantis, linea AC¹ radius visualis in continuum ductus ad contactum sui cum plano, et linea <BC> sit planum a pede rei mensurandae ad contactum sui cum radio visuali. – Est ergo unus magnus triangulus ABC, et alius partialis EDC, quorum latera proportionalia esse sic demonstrabo²: Lineae AB et DE sunt aequae distantes, super quas cadunt 2 lineae rectae, superius AC et inferius BC. Per 29. igitur primi Euclidis angulus CED³ est aequalis angulo CBA, et angulus C est communis in utroque triangulo. 3 igitur anguli unius sunt aequales 3 alterius. Sed quia⁴ anguli unius trianguli omnes sunt aequales angulis trianguli alterius, per 6. sexti latera unius sunt⁵ proportionalia lateribus alterius. Quae ergo est proportio EC ad DE trianguli DEC, eadem erit proportio BC ad AB trianguli ABC. Tunc utaris hoc principio: Cum 4 magnitudines sive numeri sic se habent, sicut se habet primum ad secundum, sic tertium ad quartum, si secundum⁶ multiplicaveris per tertium et productum [dividis] divideris⁷ per primum, [et] exhibit quartum, ut patet in his numeris 2 6 3 9 vel 3 6 4 8. Et nota diligenter quod, cum dico sic, comparando magnitudines adinvicem, ”sicut se habet hoc ad hoc”, tunc⁸ semper quod primo enuntio erit <primum>, quod secundo secundum etc. Cum ergo latera EC ad ED sic <se habent sicut> BC ad BA, tunc EC⁹ erit primum, ED secundum, BC tertium, BA quartum, quod est ignotum. Duc ergo secundum in tertium, et divide productum per primum, et exhibit quartum¹⁰, quod est quaesitum. Sed tu quaeres, quid istorum ponam primum, quid quartum? dico quod illud debet poni quar-

tum, quod inter ista est ignotum et quod hic quaero, et ideo proportionale erit tertium, et pars tertii <erit primum** et pars quarti> erit secundum, scilicet ED. – Ex his patet quod, si sciretur ubi radius visualis transiens per summitatem rei retroductus in planum attingeret, per iam dicta esset facile invenire altitudinem rei; et ideo, quia istud non est facile invenire, ideo varietas huius quodam alio modo invenitur. Quia <sicut>, si in hora considerationis perpendiculum quadrantis <cadit super lineam mediam quadrantis>, quanta¹¹ est distantia oculi a terra, tanta est distantia pedis a puncto contactus radii visualis retroducti cum plano, sic apparebit in demonstrationibus mensurationum <quod proportio> umbrae rectae ad 12 erit proportio distantiae pedis a puncto contactus ad elevationem oculi. Et ideo sicut prius ad habendum altitudinem rei per ED multiplicamus BC et productum dividimus¹² <per EC>, sic[ut] iam per 12 puncta multiplica BC et productum divide per puncta accepta. Quia ED semper eadem, quia divisibilis in 12, ideo sibi correspondet totum latus, scilicet 12 puncta; sed quia, secundum quod considerans magis[ter] accedit ad rem et a re recedit¹³, plura et pauciora puncta abscindit perpendiculum, [CEB] puncta hic <accepta> correspondent distantiae pedis ad contactum plani cum radio visuali, quia et haec distantia maioratur et minoratur secundum accessum et recessum considerantis ad rem vel a re. Haec igitur figura et haec demonstratio est quasi via ad demonstrandum.

Aliter^{13a} haec enim figura, licet sit propria ad demonstrandum rei altitudinem, cum rei altitudine <m> accipimus per radium visuaalem, faciliter trahi potest ad demonstrandum idem, cum loco radii visualis utimur radio solis. Cum enim sol est in horizonte, umbra rei est maxima, sed¹⁴ cum est in zenith, est minima necessario; cum est in medio inter horizontem et zenith, est media et rei aequalis; et tunc cadit perpendiculum super lineam mediam quadrantis [in utraque latera quadrantis] inter utraque latera umbrarum in quadrante. Et res cum umbra est aequalis, quando perpendiculum cadit in medio; ideo cum in alteram partem declinat, semper quae est proportio punctorum umbrae ad 12, eadem est proportio umbrae ad rem, et loquor de punctis umbrae rectae; ita quod illa puncta umbrae rectae erunt primum, 12 secundum, umbra[m] tertium, et res erecta quartum. Duc igitur secundum in tertium, et productum divide per primum, et exhibit quartum. Vel etiam non cures de conversione umbrae versae in

rectam¹⁵, sed cum perpendiculum cadit super aliquot puncta in latere dextro, fac sicut modo dixi et auctor¹⁶ dicit; sed cum cadit super aliquot puncta in latere sinistro, tunc e converso 12 puncta erunt primum, et puncta super quae cadit perpendiculum secundum, et semper umbra tertium; duc ergo secundum, et cetera. Et inuenies, si cadit super dextrum latus, quod semper umbra minor est re de tanto, quanto puncta, super quae cadit perpendiculum, sunt pauciora quam 12; et si cadit super sinistrum, de tanto erit umbra longior re, de quanto 12 excedunt puncta, super quae cadit perpendiculum.

Figura supradicta adaptatur¹⁷ congrue ad inventionem¹⁸ altitudinis rei per umbram et baculum: sit enim res erecta sicut prius AB, et umbra comprehensa infra triangulum ABC, ita quod conus umbrae sit C, iuxta quem erectus est baculus¹⁹ DE. Et tunc argue sicut prius: sicut se habet EC ad ED, sic BC ad AB, quia latera hic proportionalia sunt, ut visum est prius; quod autem prius est radius visualis ABC, iam est radius solis, quae est limbus umbrae. Per hanc etiam figuram demonstratur intentum, cum per baculum et oculum iuxta terram positum summitatem²⁰ rei intuetur aliquis.

Ad demonstrandum rei altitudinem, cum sita fuerit in valle, sit figura sequens:

et sit vallis GBF, et res erecta mensuranda AB, et planum in quo stat considerans sit FC; radius visualis transiens per ambo foramina, perpendiculo cadente super latus "AB"²¹ quadrantis, sit linea DE; et punctus signatus²² in re mensuranda sit D; radius autem visualis, perpendiculo cadente super lineam mediam, sit linea AE²³; illa eadem ducta in retro ad contactum cum plano sit AC. Ad demonstrandum igitur intentum, a puncto F trahatur linea <per> proposi-

tionem primam primi; ducatur autem aequè²⁴ distanter lineae ED per 12. primi; et sit linea FG, pars lineae CG. Figura igitur sic disposita²⁵, demonstrabo²⁶ altitudinem AB sic: Hic est unus triangulus AGC, et <alius> ADE, quorum duo latera unius probabo esse proportionalia duobus lateribus alterius, sic: duae sunt lineae aequè distantes, quae sunt CG²⁷ et ED²⁸, super quas cadit linea AC²⁹: per 29. primi, anguli AED [et CE] et ACG sunt aequales. Item super easdem cadit AG³⁰: igitur per eandem 29., anguli ADE et AGC³¹ sunt aequales. Item angulus A est communis in utroque triangulo. 3 igitur anguli unius trianguli sunt aequales tribus angulis alterius. Ergo per 6. sexti, latera erunt proportionalia; quae ergo est proportio [DE ad] GC ad GA, eadem est proportio DE ad DA; igitur C <G> est aequalis GA per ea quae ostensa sunt in demonstratione prima, quia comprehenduntur infra radium visualem, perpendicularo cadente super lineam mediam quadrantis. DE³² ergo et DA erunt aequales. Cum ergo DE est distantia inter considerantem et rem, DA eodem modo est distantia inter summitatem rei a puncto notato: quantum ergo est inter considerantem et rem, tanta altitudo rei a puncto notato in sursum; cui si addideris distantiam quae est inter B et D, [et] exhibit altitudo totius AB. Sed tu dicis, quantitas BD est mihi ignota: dico quod <si> sit tantae elevationis, quod punctum D non possit manu vel baculo tangi, et sic altitudo eius non potest mensurari hoc modo, tunc in valle existens cum re erecta accipias altitudinem illius puncti per quadrantem, ut prius dictum est, et sic semper erit altitudo puncti nota.

"FRATER PETRUS INGUARI STUDENS ROSKILDENSIS".

København, Gl.kgl.S., 1810,4°. Vellum and paper, 22×14½, ff.76. Earlier possessed by a court physician of Frederik I (1523-33). The manuscript is mainly written in two hands from the 14th c., and the bulk of it is occupied by Sacrobosco's Sphere, Computus, and Algorism. One may also note a list of eclipses for 1313-1330 (f.5r), and an anonymous text of ?William of St.Cloud's Directorium (f.7r: *Calendar*, App.5(h3)).

On ff.1r,7v,68v,69r-v, and 74r-v, there are notes, apparently in one hand, from the 15th c. Since 74r has a dating and 74v bears the subscription in question, I print them in full while giving extracts of the rest. "App." refers to the Appendices in the edition of the *Calendar*.

Jørgensen 1923,421-2 (full descr.). Notes by J.W.S.Johnsson, see *Introduction* §10d. Sarton II, 1931, p.997. OP p.48.

1r (Top:) Haec est tabula planetarum. Planetæ dierum: Sol luna Mar quoque Mer Iupiter Venus atque Saturnus. Planetæ horarum: Sol Ve Mer luna Saturnus Iupiter et Mars. (Rota for planetary domination in hours, with sectors/zones corresponding to rows/columns in a Planet table, 7 rows, 24^h.) (Bottom:) Qualitates planetarum. Jupiter atque Venus. . .mediocres (:App.6(c)).

7v (Top:) Nota, signa zodiaci sunt 12, et hæc sunt figuræ. Tabula signorum. Est aries taurus. . .caper amphora pisces. (Rota(12), with names of zodiacal signs, and figures of their constellations; compass directions are added, "oriens" corresponding to Aries.) (Bottom:) Cornu arietis habet stellas sic positas (:figure, then three more such notes).

68v (Top:) Ista tabula vocatur testimonium planetarum, quia invenitur hic mutatio aëris et virtutes atque dispositiones planetarum.

(Rota(12 sectors, 7 zones), contents as in the "tabula dignitatum 7 planetarum" in ms.Ba(App.6(d10)),149v. No canon. Johnsson observed a similar rota in ms. K of the *Calendar*, at 140r. This, however, occurs in an astrological miscellany of the late 14th century, unconnected with Peter of Dacia).

69r-v (App.6(d6):) Aries. Nil capiti facias. .sit potio sumpta sal-
 <ubris>. Expliciunt qualitates signorum <...*(stain)*>.

74r (Hdg.): Tabula continuationis coniunctionis. (Txt:) Sciendum vero quod practica istius tabulae sine subtractione horarum durat per 19 annos, capiendo initium annorum anno domini 1394 currente. Post lapsum vero illorum annorum, quod erit anno domini 1413 currente, istud praecedens non est <*> concordantia tabulae subsequens. Ad propositum vero istius tabulae, si horas veras et horarum minuta scire volueris, tunc scias annos a nativitate Christi, quos quaere in subscripta tabula, quae intitulatur Tabula continuationis coniunctionis:

(Rota, with sectors like the columns following, all numbers repeated:)

Anni	1394	1413	1432	1451	1470
Horae	0	7	14	22	5
Minuta	0	24	5	22	28

(Txt:) Horas autem et minuta, quae sunt ex directo annorum domini, subtrahe ab horis et minutis in hac tabula positis. Si autem annos praedictos non inveneris, tunc recipe annos domini praecedentes in praefata tabula scriptos, <et> horas et minuta, quae sunt ex directo illorum annorum, [et] subtrahe. Si autem contigerit quod minuta a minutis subtrahere non poteris, tunc ab horis recipe unam horam et illam resolve in 60 minuta, et subtrahe; similiter si horas ab horis subtrahere non potes, recipe diem coniunctionis et resolve eum in 24 horas, et subtrahe. Et habebis horas cum suis minutis certissime. Verbi gratia, anno domini 1394 (1494 *ms.*) currente nihil subtrahetur ab horis et minutis, donec elabuntur 1413 anni incompleti; tunc 7 horae et 24 minuta ab horis et minutis hic inventis subtrahentur, et illa subtraxio durabit usque ad annos domini 1432 incompletos. Et sic haec tabula parvula durabit, a principio usque ad finem, fere ad C annos. Explicit.

(A closely parallel text is the canon to the *tabula continuationis coniunctionis* appended to the Austrian calendar App.5(j9), ms. Bf,7r+; the text and table are at 14v-15r, beginning in 1425 and with the values 0^h;0 7;28 14;56 22;24 5;52. There is no calendar in the present manuscript.)

p.18 **74v** (Top:) Haec tabula vocatur tabula minutionis.

Nota signa 12:

Est aries taurus gemini cancer leo virgo
Libraque scorpius architenens caper amphora pisces.

Nota situationes eorundem:

Dum minues leo bis numeres aries capricornus
Unda liber taurus geminos virgique sagitta,
Cetera ter ponas per quae tibi norma patebit.

(Bottom:) Nota qualitates signorum:

Est aries minuendo bonus liber unda sagitta,
Can sco ge pis media, cetera vero mala.

Nota litteras signorum in capitibus mensium positorum:

Ian petit A, sed Martius F, Iul et S numerando,

quat	14 es	C		

(Left margin:) Nota, pro uberiori declaratione tabulae illius artificialiter habenda: si scire volueris in quo die et quo signo luna fuerit, primo in radice indicis ponentur isti versus scilicet "Cisio Ianus", et computentur singulae iuncturae inclusive usque ad diem quaesitum. Quo habito, in radice eiusdem indicis recomputentur eadem iuncturae cum isdem metris, et hoc cum aliquibus litteris in principio cuiuslibet mensis situatis, quae patent per haec metra "Ian petit A sed Martius F"; et computabitur ut prius ad diem pro quo quaesitum erat; et haec littera reperta, diei tali apta, memoriae commendetur. Deinde sumetur littera in supremo sita directe in linea arietis, aureoque numero non inepta, per haec metra "Iota per ξ etc.", et computetur ut prius per haec metra "Est aries taurus", ita tamen quod quaelibet iunctura sumet quodlibet signorum bis vel ter per haec metra "Dum minues leo bis numeres". Et sic per talem practicam pervenitur ad verissimae rei experientiam exsequendam. Haec frater Petrus Inguari studens Roskildensis. – Nota quod ista littera "9" duplicabitur computando.
